Does this abstract contain original data?: Yes

Will this abstract be published/presented prior to June 2016?: No

This abstract is: A pathology submission

Does your Endoscopy abstract include a video?: No

Preferred presentation type: Oral or Poster

**Introduction:** The prevalence of iron deficiency anaemia (IDA) is 2-5% in the developed world. The BSG IDA guidelines recommend screening for coeliac disease (CD) with serology, and those tested positive should undergo duodenal biopsy to assess for villous atrophy (VA). The availability of pre-endoscopy serology in IDA has been shown to be 30%, thus often committing clinicians to routinely biopsy the duodenum. We aimed to explore whether any causes other than CD would be found on duodenal biopsy in IDA. We also aimed to evaluate the role of Simtomax, an IgA/G-deamidated gliadin peptide based point of care test (POCT), in detecting CD in IDA in the endoscopy setting.

**Methods:** Group 1: we retrospectively reviewed the duodenal histology of 153 patients with IDA attending a non coeliac specialised IDA clinic in 2013-14. Group 2: we prospectively recruited 133 patients with iron deficiency attending for a gastroscopy to our research gastroscopy list. All patients undertook Simtomax, endomysial antibodies (EMA), tissue transglutaminase (TTG), total IgA, and 5 duodenal biopsies. The results were compared against histology.

**Results:** The duodenal histology in group 1 yielded no cause for the IDA apart from CD. Two patients had VA- 1 with positive serology and hence was diagnosed with CD; the other patient never had a serology to confirm the diagnosis as he subsequently died from colon cancer. Assuming the latter case to be CD, the prevalence of CD in this cohort would be 1.3%. 5/7 patients with lymphocytic duodenosis (LD) had a cause for or association with LD: vitiligo, autoimmune hypothyroidism, aspirin use, proton pump inhibitor use, and Helicobacter pylori infection respectively. No attributable causes for LD were found in the remaining 2 patients. In group 2, the prevalence of CD was 19.5%. The sensitivity and NPV of Simtomax were 100%.

**Conclusion:** Our duodenal histology review revealed no alternative causes for the IDA other than villous atrophy secondary to CD. Simtomax had 100% sensitivity and NPV for detecting CD in IDA. This suggests that performing a duodenal biopsy in patients with a negative Simtomax test is highly unlikely to yield a diagnosis for IDA, thus could be safely avoided if the sole purpose of the biopsy is to investigate IDA. Simtomax could provide significant cost savings by targeting patients with IDA who require a duodenal biopsy.
Disclosure of Interest: M. Lau: None Declared, P. Mooney: None Declared, W. White: None Declared, M. Burden: None Declared, S. Wong: None Declared, M. Kurien: None Declared, S. Cross: None Declared, J. Hebden: None Declared, D. Sanders Grant/research support from: Tillotts Pharma for investigator led studies in coeliac disease.
