Anthocyanins

- Found in fruits, vegetables, flowers

Anthocyanin	R ₁	R ₂	λ_{\max} @ pH3
pelargonidin	- H	- H	503
cyanidin	- OH	- H	517
peonidin	- OCH ₃	- H	517
delphinidin	- OH	- OH	526
petunidin	- OCH ₃	- OH	526
malvidin	- OCH ₃	- OCH ₃	529

- Glycosylation typically at 3-O position
- In fruits, typically various mono- and disaccharides
- More complex glycosylation observed in other plants

STRAWBERRY (*Fragaria × ananassa*)

1. Pelargonidin 3-*O*-glucoside (86.35%)
2. Pelargonidin 3-*O*-rutinoside (13.65%)

BLACKBERRY (*Rubus fruticosus*)

1. cyanidin-3-*O*-glucoside (>95%)

BLACK MULBERRY (*Morus nigra*)

1. cyanidin-3-*O*-glucoside (73.83%)
2. cyanidin-3-*O*-rutinoside (26.17%)

BLUEBERRY (*Vaccinium corymbosum*)

1. malvidin-3-*O*-galactoside (18.1%)
2. delphinidin-3-*O*-galactoside (13.86%)
3. delphinidin-3-*O*-arabinoside (12.38%)
4. petunidin-3-*O*-galactoside (1.74%)
5. petunidin-3-*O*-arabinoside (5.52%)
6. malvidin-3-*O*-arabinoside (48.38%)

ARONIA (*Aronia melanocarpa*)

1. cyanidin-3-*O*-galactoside (68%)
2. cyanidin-3-*O*-arabinoside (30%)

PURPLE POTATO (*Solanum tuberosum*)

1. Petunidin-3-coumaroylrutinoside-5-glucoside

GRAPE (*Vitis vinifera*)

1. Cyanidin-3-*O*-glucoside (5.84%)
2. Delphinidin-3-*O*-glucoside (7.27%)
3. Malvidin-3-*O*-glucoside (65.30%)
4. Peonidin-3-*O*-glucoside (5.95%)
5. Petunidin-3-*O*-glucoside (15.64%)

BLACKCURRANT (*Ribes nigrum*)

1. delphinidin-3-*O*-glucoside (15.71%)
2. delphinidin-3-*O*-rutinoside (43.25%)
3. cyanidin-3-*O*-glucoside (7.03%)
4. cyanidin-3-*O*-rutinoside (34.00%)

Clean extraction

- Polar metabolites such as anthocyanins can be extracted using water, ethanol or blends of the two solvents

 Non-toxic solvents that allow efficient extractions in optimised conditions
Acceptable solvents for food or personal care and cosmetic applications
No-regulatory limitations

 Non-selective solvents
Free sugars, proteins and low-polarity metabolites are extracted too

Solid-Phase Extraction (SPE): strategy for extract purification

- Anthocyanins interact with solid phase *via* H-bonding and hydrophobic interactions
- Resin allows for removal of interferents *via* preferential sorption of active
Free sugars removed with acidified water
Anthocyanins subsequently eluted with acidified ethanol

 Simple, safe and low cost
Allows high recovery of active
Reduces consumption of solvents

 Source needs to be loaded in water
Scale-up limitation?

Industrial-scale process

Extract from blackcurrants (*Ribes nigrum*) grown in UK

- sustainably sourced
- waste from blackcurrant juice process (Ribena)
- Extracted and purified using green technology
 - Aqueous process, clean, energy efficient
- High levels of both anthocyanins and flavonoids
- Patented¹ semi-permanent hair colorants and coloration process
 - Range of shades, fast to 12+ washes

Dyeing from acidic medium (pH 3-4)

- λ_{\max} in aqueous solution at pH 3.0: cyanidin 517 nm; delphinidin 526 nm
 - purple/violet colour consistent with flavylum cation

- λ_{\max} when adsorbed onto hair from aqueous medium:

570-580 nm

- Blue colour consistent with quinonoidal base
- *in situ* neutralisation by basic sites on hair surface leading to formation of anhydrobase
- Stable over 12+ washes, minimal colour loss, no colour change

100mg
4.0wt%

10.22
570nm

Sorption studies

- sorption significantly in excess of theoretical monolayer capacity
- Formation of **hemimicellar** (side-by-side) and **admicellar** (stacking) aggregates

Blackcurrant anthocyanins

Delphinidin-3-Glucoside

Delphinidin-3-Rutinoside

Cyanidin-3-Glucoside

Cyanidin-3-Rutinoside

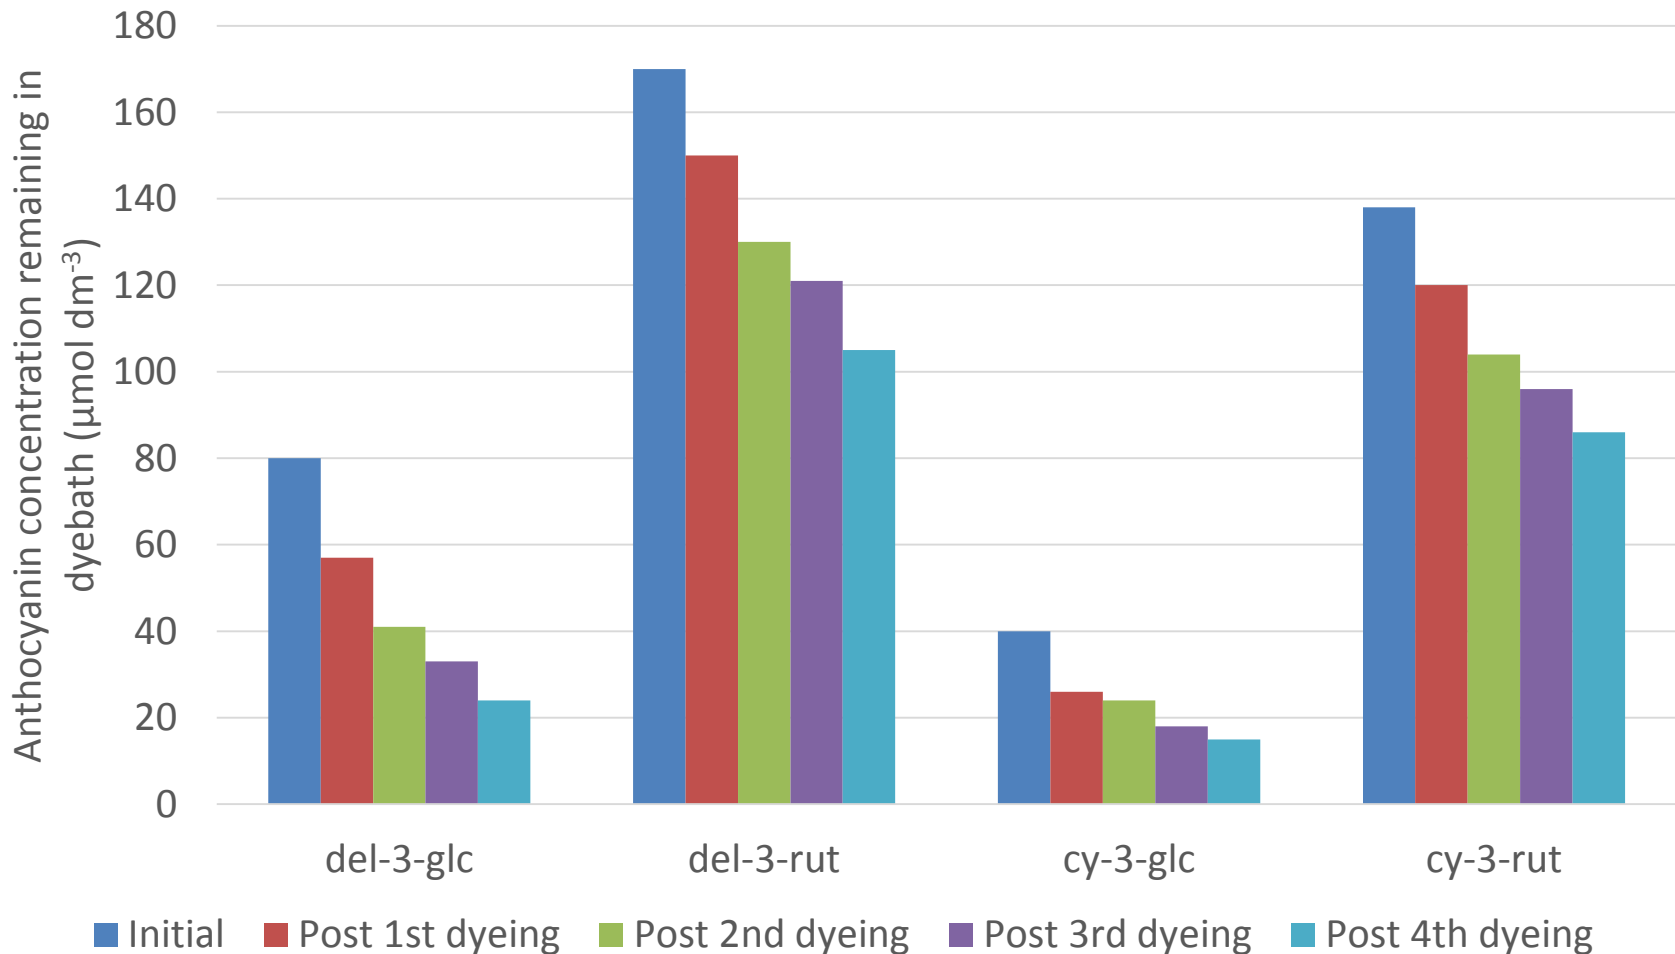

Glucoside Unit

Rutinoside Unit

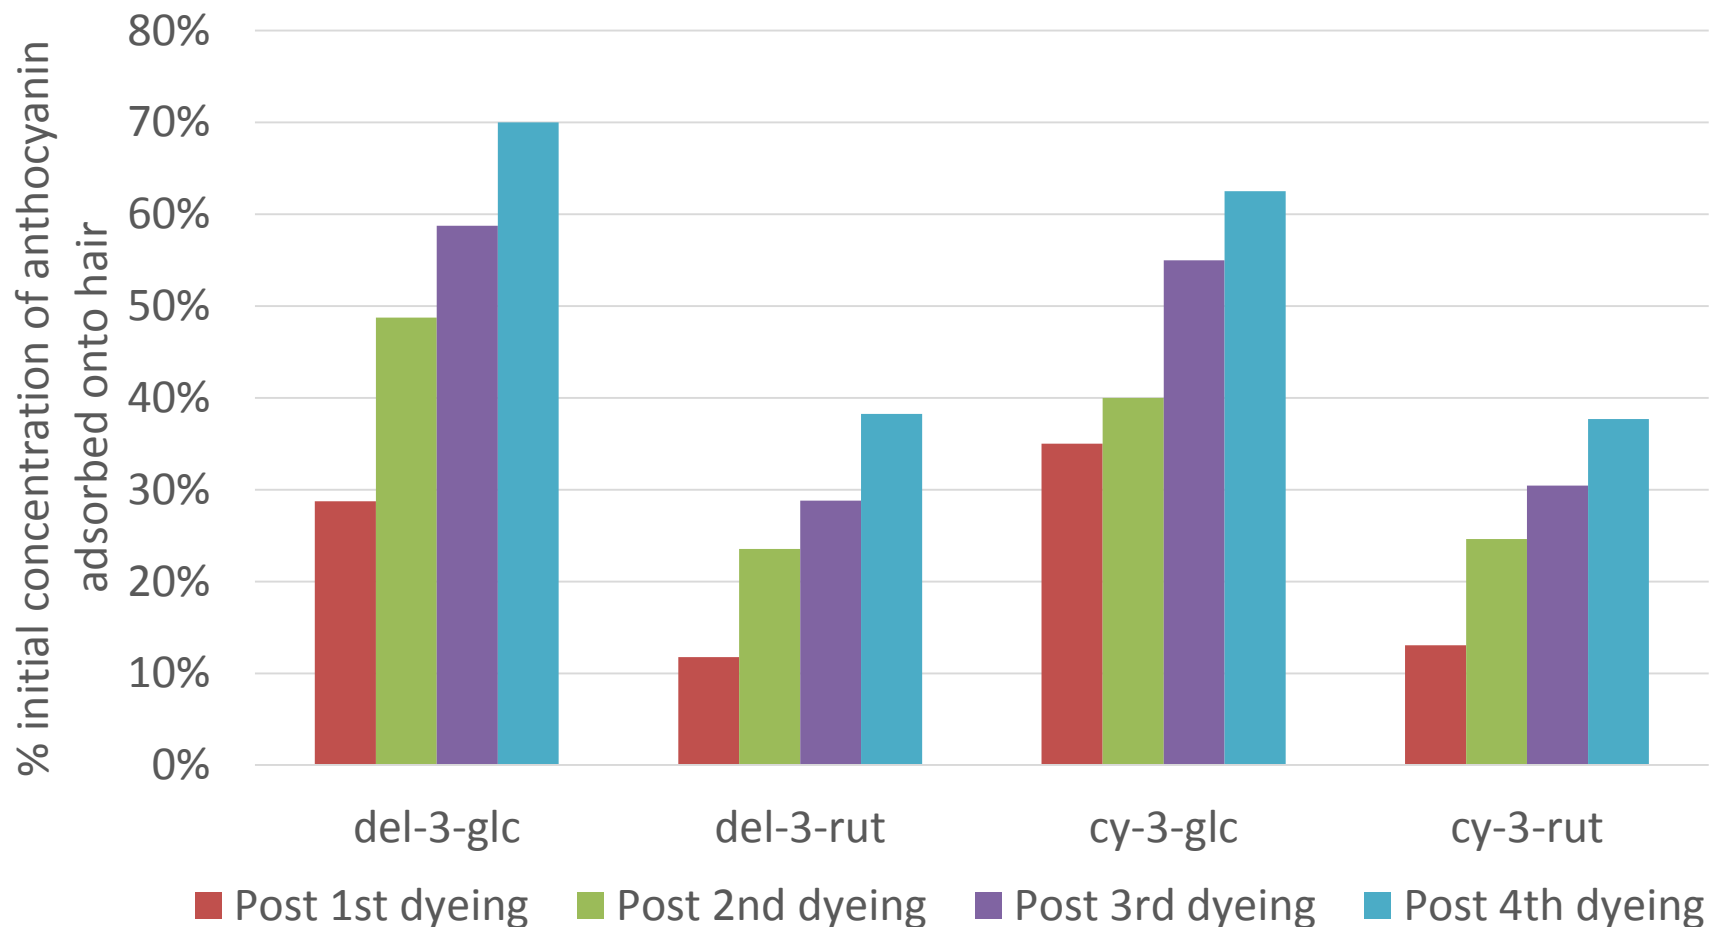

Successive dyeings from solution (amount remaining)

- All anthocyanins adsorb onto bleached hair

Successive dyeings from solution (amount adsorbed)

- Apparent preferential adsorption in favour of monosaccharides (glucosides) – ca. 2-fold over disaccharides (rutinosides)

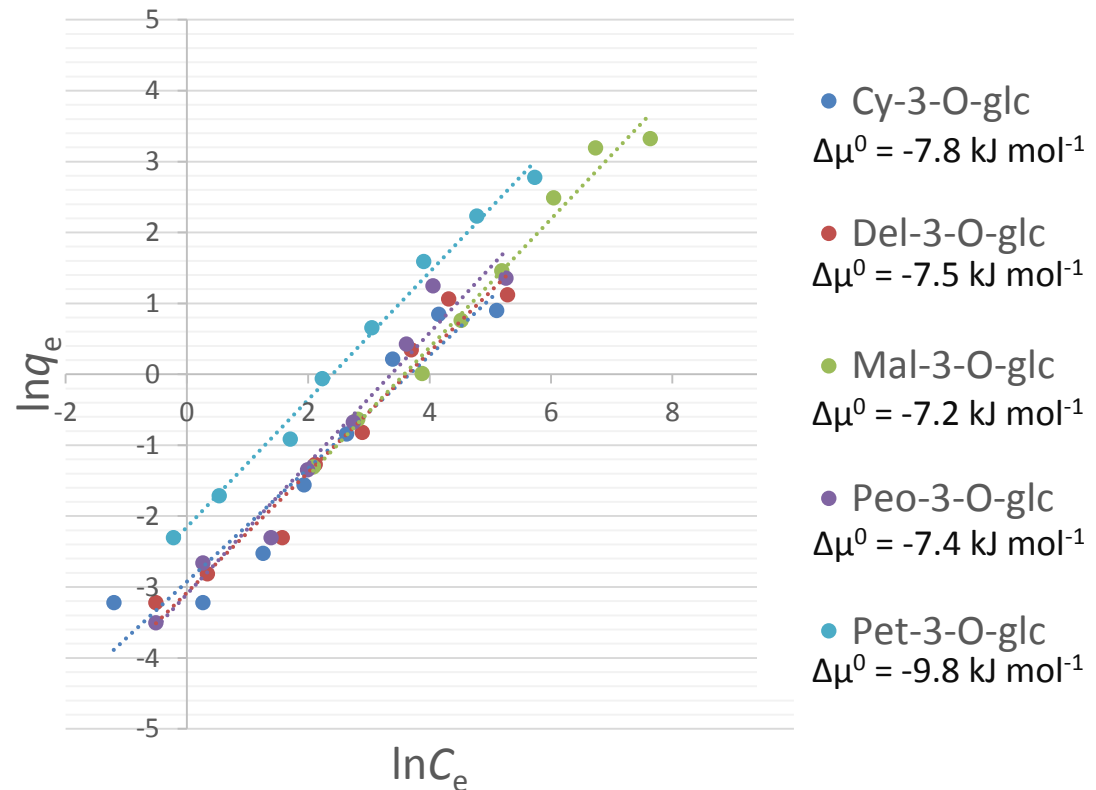

Blackcurrant glycoside sorption

- Isotherm study: cyanidin-3-O-glucoside higher adsorption energy in comparison with cyanidin-3-O-rutinoside
- Superior H-bonding through primary hydroxyl? Steric effects?

Grape glucoside sorption

- Isotherm study: Most glucosides show consistent sorption properties
- Unexplained sorption differences for petunidin-3-O-glucoside
- However, generally anthocyanin parent structure does not have significant effect on sorption – glycosylation more important

The Challenge

- Blue food colorants dominated by *Brilliant Blue FCF* (E133)
- Can induce allergic reactions
- Regulation a big issue
- Blue from nature most difficult to achieve

The Market Opportunity

- *B. Blue FCF* ca. 1,300 tpa
- Market value >\$260m
- Industry → natural colorants
- Spirulina only current natural blue, but has application and stability problems
- Stable, natural blue highly desirable

The technology

- Anthocyanins extracted from sustainable source plant materials
- Lake pigment formed using novel “biomimicry” process
 - inspired by plant pigment formation in flowers
- Pigments in a range of colours suitable food application
- Both water soluble and water insoluble pigments are possible

Plant sources identified

Pigments formed
(water-soluble and
water-insoluble)

Formation of metal complexes with blackcurrant anthocyanins

Stability of complex to citric acid

- Very low concentrations of citric acid cause a colour change to red, significantly higher than pH 2.8
- Effect with malic and lactic acid was not as extreme, but still a colour change was observed at relatively low concentrations
- Acetic acid could be used in much higher concentrations before any colour change was observed
- Effect not directly related to pH - citric acid has a propensity to complex Al^{3+} , abstract the metal from the colorant complex, and cause the complex to break down

Acid	Ratio (mmol acid per g colorant)				
Citric	0.00	0.11	0.53	1.60	3.71
	Blue	Blue/ Purple	Red/ Purple	Red	Red
Malic	0.00	0.27	0.78	1.34	7.39
	Blue	Blue/ Purple	Red/ Purple	Red	Red
Lactic	0.00	0.70	1.67	2.78	10.89
	Blue	Blue/ Purple	Red/ Purple	Red/ Purple	Red
Acetic	0.00	3.67	8.50	11.17	13.33
	Blue	Blue	Blue/ Purple	Blue/ Purple	Blue/ Purple

Example formulations in confectionary products

No acid

Citric acid

Acetic acid

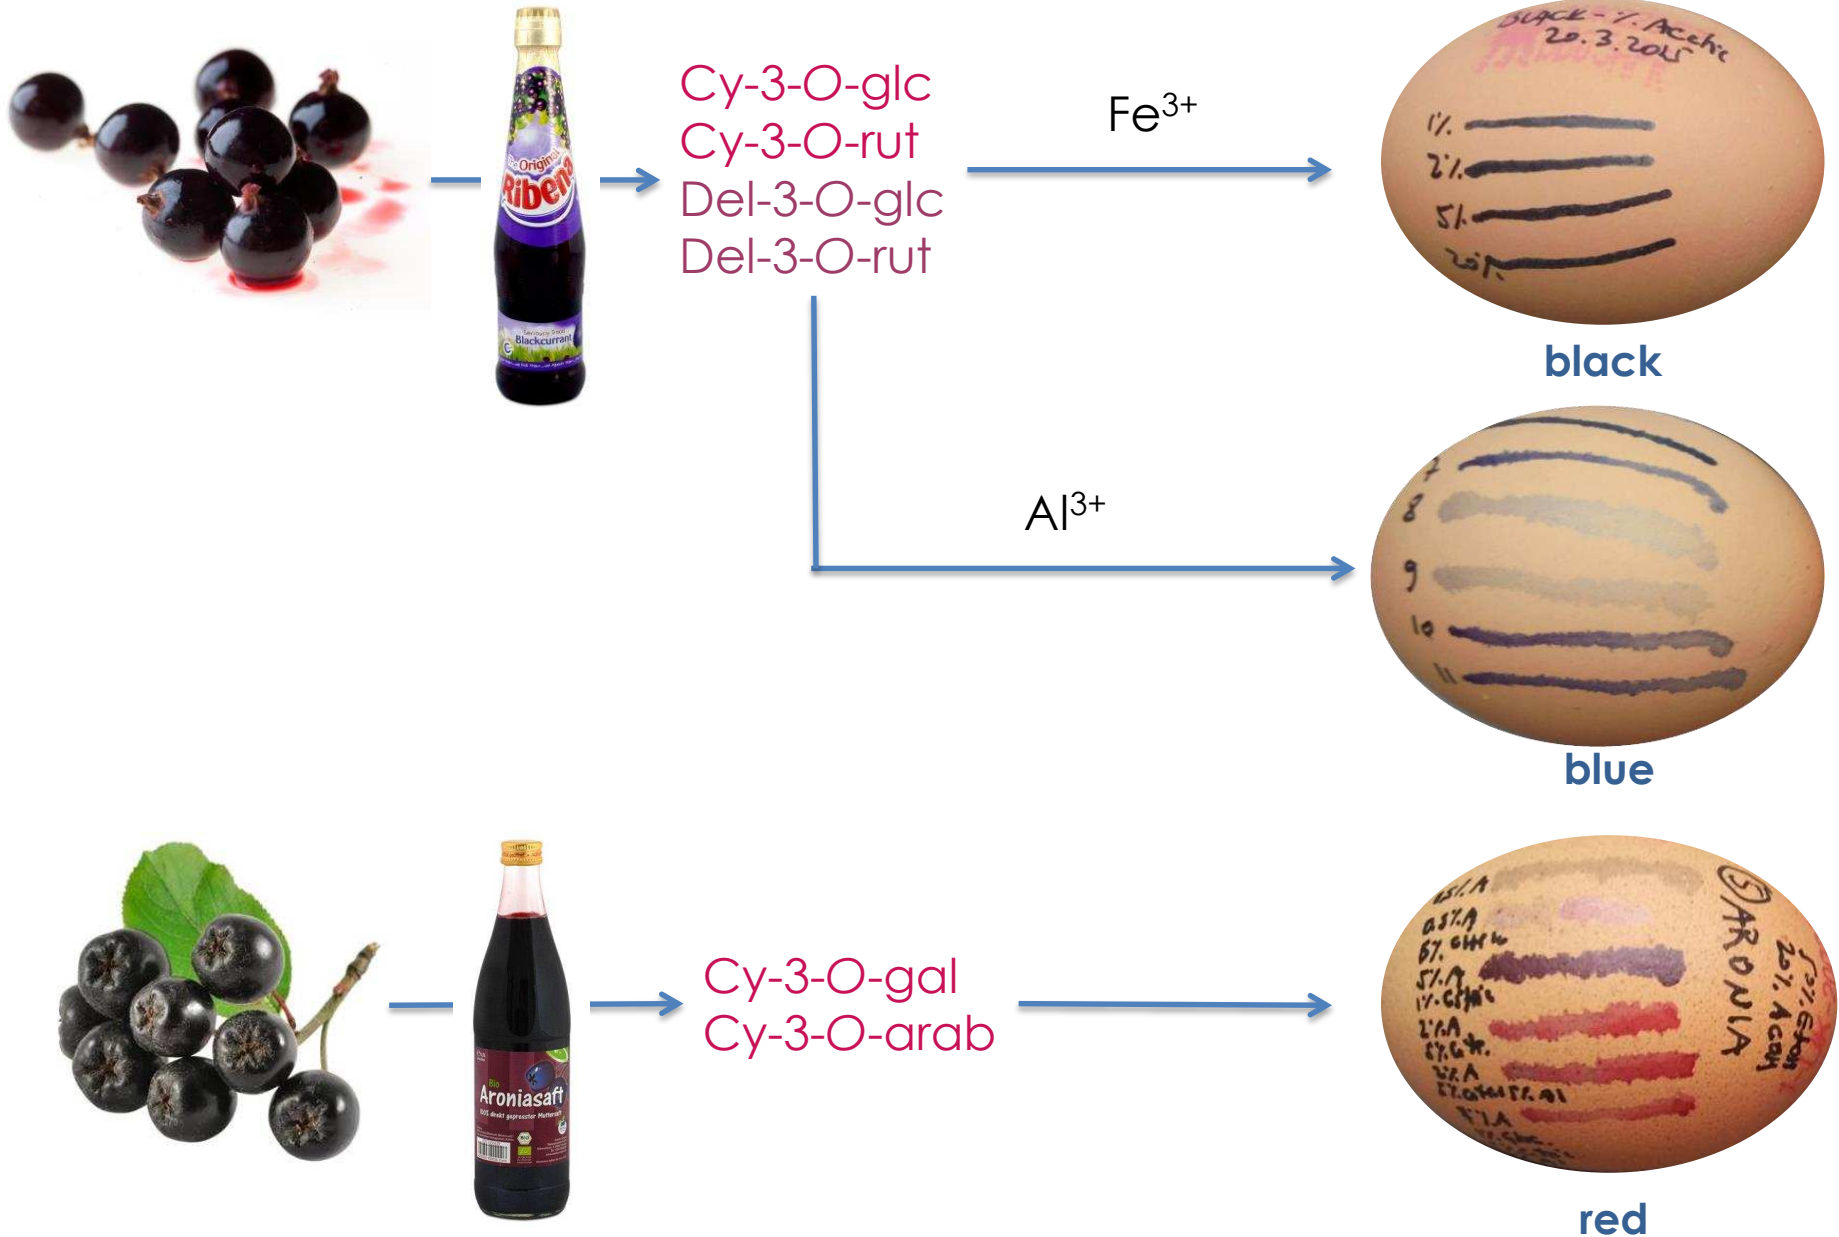

Formulation of inks for egg coding applications using dyes extracted from waste food products

- Inks developed using colorants extracted from natural waste materials²
- Increase in the information placed on an egg
- Reduced environmental and toxicological impact
 - Some current concerns over erythrosine
- **Enhance security, safety, and traceability**

Case Study 3: Marking eggshell

New inks technically superior to erythrosine

- Good adhesion, excellent water fastness, no penetration of colorant into egg interior
 - Binding with Ca^{2+} in CaCO_3 eggshell forms stable complex (known that Ca^{2+} involved in anthocyanin complex formation in blue flower petals³)
 - Also protein in eggshell matrix may contribute to interactions with anthocyanins
- Provide high print definition to achieve text and barcoding
- Increase in the information placed on an egg
- Technology being trialled by egg producer in UK

Functional, natural, sustainable
