15 European nuclear nationalism

UK and French perspectives on nuclear disarmament

Nick Ritchie and Benoit Pelopidas

The UK and France were the first sub-superpowers to develop nuclear forces after participating in the US Manhattan Project. Despite critiques in the two countries, the British and French decision-making elites never felt that a US pledge of extended nuclear deterrence could substitute for what they regarded as independent nuclear forces (Pelopidas 2015a). In both countries, the development of a nuclear arsenal coincided with the loss of a colonial Empire, the brutalizing impact of six years of “total war” against Nazi Germany, and the forging of an uncertain new world order. Both countries have justified the continued possession of nuclear weapons through reference to notions of “strict sufficiency” (French Government 2008: 120, 168, author’s translation; French Government 2013: 73; Simon-Michel 2014a: 2) to meet evolving conceptions of “minimum deterrence” throughout the nuclear age. After the Cold War, both countries initiated modernization programs for their nuclear forces (French Government 2008: 170) while at the same time reducing their numbers, which is now the general tendency across nuclear-armed states (Mecklin 2015). Since the Ottawa declaration of 1974,¹ the two nations, both founding members of NATO, have argued that their nuclear forces contribute to the deterrent capacity of the Alliance (North Atlantic Council 1974: para 6; NATO 2010: para 18). In 2010, the two countries signed a fifty-year treaty to develop and operate joint nuclear warhead diagnostic facilities in the UK and France, which cemented a nuclear-armed path dependency for both nations for the foreseeable future (Harries 2012). Beyond these commonalities, France and the UK have had different approaches to the possibility of nuclear disarmament; these derive from the different post-Second World War national narratives in which the development of nuclear weapons has been embedded. This started from two different attitudes toward the NATO Alliance and its nuclear component, two different sets of lessons learned from the 1956 Suez crisis (Pelopidas 2015a), and it culminated in two different reactions to the increase in nuclear disarmament advocacy worldwide, which is the focus of this chapter.

The UK conducted its first nuclear test in 1952, becoming the third country to do so. In 1957, it entered the ranks of the thermonuclear

powers with the detonation of a 1.8 megaton shot off Christmas Island in the central Pacific. Three years later, in February 1960, France detonated its first A-bomb in the Algerian desert. In October 1964, the air component of the French nuclear forces entered service and, in 1968, Paris detonated its first H-bomb. In 1971, the land-based component was finalized in Provence with eighteen silos built on the plateau d'Albion, where short-range Pluton and Hades missiles would be placed. In 1972, the first French ballistic missile submarine, *Le redoutable*, entered service. In the 1990s, the land-based component of the French nuclear forces and the test site in the Pacific Ocean were dismantled.

The UK currently has a nuclear stockpile of 225 warheads that arm its US-designed and built Trident II (D5) submarine-launched ballistic missiles deployed aboard four Vanguard class ballistic missile submarines. The system is collectively referred to as “Trident,” which encompasses the missiles, submarines, and warheads. The UK embarked on a long, expensive, and controversial project to replace the Trident system in 2007, beginning with the procurement of a new class of ballistic missile submarines.² The intention is to retain a strategic nuclear weapons capability well into the second half of the twenty-first century after the new submarines enter into service in the 2020s and 2030s.

The French arsenal is similarly expected to last for the next two to three decades at least, with the recent addition of modified nuclear-tipped air-to-air missiles (ASMPA) and the four French ballistic missile submarines that are being adapted to deploy the new M-51 submarine-launched ballistic missiles, a new version of which is being developed. The French President has ordered preparatory studies for the third generation of ballistic missile submarines, the replacement of Mirage 2000N by Rafale, and the evolution of the ASMPA cruise missile, as well as the preparation of the successor generation, ASN4G, which are referred to in laws detailing the military programs for 2014–2019 (French Government 2014: 38).

The UK decision to replace the Trident system was driven by a number of factors, notably the perceptions of strategic national security threats from nuclear-armed adversaries and an abiding belief in the efficacy of nuclear deterrence (what Booth and Wheeler (1992) call “nuclearism”).³ Other factors include the importance of reproducing the “special relationship” with the USA, industrial concerns about retaining a sovereign capability to build nuclear-powered submarines, and, perhaps most importantly, a particular elite conception of national identity in terms of who “we” think we are and how we think “we” should act in the international political arena. The latter reflects what Hennessy (2007a) labels a “gut instinct” that the UK should be and must remain a nuclear power.

There is, however, resistance to “business-as-usual” for another generation of nuclear weaponry. This is reflected in deep disquiet within the UK government and among the general public about the necessity and wisdom of investing heavily in reproducing a strategic nuclear weapons

1 capability procured in a different era to deter an adversary that no longer
2 exists, despite difficult relations with Russia over its annexation of Crimea
3 in 2014 and the strategic destabilization of Ukraine. It is rooted in concerns
4 about cost in an era of welfare austerity and significant cuts in the
5 defense budget. It reflects a different hierarchy of national security challenges
6 in which nuclear weapons have little value, as well as a desire to
7 support the nuclear Non-Proliferation Treaty (NPT) by taking significant
8 steps toward nuclear disarmament (Ritchie 2012). This last point of resistance
9 was transformed by the resurgence of an international nuclear disarmament
10 agenda in January 2007, just a month after the Labour government under Tony Blair
11 published the White Paper *The Future of the United Kingdom's Nuclear Deterrent*
12 in December 2006, setting out the case for the replacement of Trident.
13

14 Since the late 1970s, with the conversion of the French socialist party to
15 nuclear deterrence and the progressive decline of the communist party,
16 which similarly gave up criticizing nuclear deterrence, French officials
17 have shown no similar discomfort with the possession of nuclear weapons
18 by the Republic and no major governing party is opposed to a continued
19 possession of nuclear weapons. The green parties oppose both nuclear
20 weapons and nuclear power, which puts them at a political disadvantage
21 in a national context in which more than 70 percent of electricity comes
22 from nuclear sources. It would be false, however, to argue that there has
23 not been any criticism of those weapons in France. Critical voices are
24 simply left out of official circles (Pelopidas 2012, 2015b). For example,
25 non-violent movements (religious or not), environmentalists, and military
26 personnel willing to preserve the link between the army and the nation
27 have formulated critiques for a long time. In 1964, the year when the first
28 component of the French nuclear arsenal entered service, Georges Izard,
29 a lawyer who would soon become a member of the Académie française,
30 published his *Lettre affligée au général de Gaulle* [Afflicted letter to General
31 de Gaulle] (Izard 1964), which summarized almost all the non-communist
32 and non-moral critiques that are voiced today. The weapon system was
33 described as: primarily dangerous due to the impossibility of protecting
34 populations against a nuclear strike and the status of primary target
35 granted by the possession of nuclear weapons; potentially useless and
36 resulting from a misguided inability to accept that France was now a
37 middle power; and, finally, too onerous. Izard (1964) suggested that,
38 instead of accepting its status as a middle power, France used the bomb to
39 compensate for the loss of both its empire and its rank among the nations
40 of the world. In the military, a majority was opposed to a French A-bomb
41 between the end of the Second World War and the Reggane test in 1960.
42 Even before the test, several anti-nuclear traditions had made powerful
43 cases against nuclear weapons. One opposed the nuclearization of the
44 country in the name of the priority that should be given to the preservation
45 of the empire. Others voiced a civic critique that nuclear weapons

were tantamount to a technocratic elite dispossessing the body politic of its control over its own defense and, as a consequence, citizens were likely to lose their sense of responsibility for the defense of the nation as they lost their sense of voluntary sacrifice for it. A third critique started with the latter assessment of a loss of responsibility and sense of sacrifice, but saw it as the source of a weakening of the population in the case of a conventional war.

Nuclear disarmament resurgent

In both the UK and France, the positive response to renewed advocacy in favor of a world without nuclear weapons was mostly based on a strategy of creating the conditions for nuclear disarmament rather than practicing it, even if the UK's rhetorical commitment to the goal is less ambiguous than the French.

In the UK, the Labour government responded to the powerful call by *et al.* (2007) for “a world free of nuclear weapons” by declaring its full commitment to this aim and a determination to take an active leadership role in examining the practical steps and challenges involved. In June 2007, the UK Foreign Secretary Margaret Beckett declared that, “When it comes to building this new impetus for global nuclear disarmament, I want the UK to be at the forefront of both the thinking and the practical work. To be, as it were, a ‘disarmament laboratory’” (Becket 2007). In January 2008, the UK Prime Minister Gordon Brown pledged that the UK “... will be at the forefront of the international campaign to accelerate disarmament among possessor states, to prevent proliferation to new states, and to ultimately achieve a world that is free from nuclear weapons” (Brown 2008). In February 2008, the UK Defense Secretary Des Browne gave a speech entitled “Laying the foundations for multilateral disarmament” at the Conference on Disarmament in Geneva. He said, “... the UK has a vision of a world free of nuclear weapons and, in partnership with everyone who shares that ambition, we intend to make further progress toward this vision in the coming years.”

In February 2009, the UK Foreign Secretary David Miliband published a policy information paper *Lifting the Nuclear Shadow: Creating the Conditions for Abolishing Nuclear Weapons*, which said, “We need an assertive and cooperative strategy, founded on the premise that the goal of a nuclear weapons free world is achievable” (Foreign and Commonwealth Office 2009: 3). The following month, Prime Minister Gordon Brown declared in a speech that the UK would develop “... a credible roadmap toward disarmament by all the nuclear weapons states – through measures that will command the confidence of all the non-nuclear weapons states” (Brown 2009). The roadmap was published later that year (Cabinet Office 2009). The UK hosted a conference of the five recognized nuclear weapons states (the UK, France, China, Russia, and the USA) in September 2009 in

1 London to explore confidence-building measures toward nuclear disarmament, the first conference of its kind. Follow-up meetings took place in
2 Paris, Washington, and Geneva, and then again in London (Ritchie 2013).

3 Outside the UK government, four former foreign and defense secretaries,
4 Malcolm Rifkind, David Owen, Douglas Hurd, and George Robertson,
5 mirrored their transatlantic colleagues with an article in *The Times* in June
6 2008 that said the world must “[s]tart worrying and learn to ditch the
7 bomb.” They argued:
8

9
10 Substantial progress towards a dramatic reduction in the world’s
11 nuclear weapons is possible. The ultimate aspiration should be to have
12 a world free of nuclear weapons. It will take time, but with political
13 will and improvements in monitoring, the goal is achievable. We must
14 act before it is too late, and we can begin by supporting the campaign
15 in America for a non-nuclear weapons world.

16 (Rifkind *et al.* 2008)
17

18 Their call was endorsed by 277 MPs in a parliamentary Early Day Motion
19 on the Nuclear Security Project the following month (Willett 2008).

20 In the coalition government that came to power in 2010, the Conservative
21 Party’s pre-election Green Paper on National Security stated, “In the
22 context of progress in nuclear disarmament and reduction, the UK must
23 be prepared to take a rigorous look at whether we can take our excellent
24 record in this area further forward” (Conservative Party 2009: 13). Conservative
25 MP David Lidington, later Minister for Europe at the Foreign and
26 Commonwealth Office, said:

27
28 ... [the] party welcomes the specific proposals that have been put
29 forward by Schultz, Kissinger, Perry and Nunn... We agreed too with
30 the long-term objective of a world free of nuclear weapons, though we
31 think that the path to that goal is likely to be slow and painstaking.

32 (Lidington 2010)
33

34 Some changes to UK nuclear weapons policy were subsequently made in
35 the Coalition’s Strategic Defence and Security Review published in
36 October 2010 (Cabinet Office 2010). The review announced further
37 reductions in the UK’s nuclear stockpile and an updated negative security
38 assurance to non-nuclear weapons states party to the NPT.

39 The Liberal Democrats, as the junior party in the Coalition, consistently
40 supported the idea of a world free of nuclear weapons. They argued that
41 the UK can and should take further steps “down the nuclear ladder” by
42 cutting the nuclear force yet further and removing it from permanent
43 alert (Liberal Democrats 2013; Ritchie 2009). To that end, in May 2011
44 they successfully sought agreement with the Conservatives for a formal
45 government review of alternative systems and postures to a like-for-like

replacement of Trident on permanent alert. The *Trident Alternatives Review* was released in declassified form in July 2013 (Cabinet Office 2013). It set out a range of alternative nuclear postures for the UK and applied these to a number of different delivery systems. The Liberal Democrats subsequently went into the 2015 General Election with a commitment to:

Retain our Trident independent nuclear deterrent through a Contingency Posture of regular patrols, enabling a “surge” to armed patrols when the international security context makes this appropriate. This would enable us to reduce the UK warhead stockpile and procure fewer Vanguard successor submarines, and would help the UK to fulfill our nuclear non-proliferation treaty commitments.

(Liberal Democrats 2014: 75)

The French government was originally taken by surprise by the renewed advocacy of nuclear disarmament in 2007–2008. French officials, as well as most of the few French nuclear experts, remain convinced that this push is temporary, that the history of the nuclear age is that of nuclear proliferation, and that a world without nuclear weapons is in the end not desirable (Pelopidas 2012; De Champchesnel 2010; Tertrais 2007, 2009a, 2009b, 2010, 2011). As a result, the goal of a world without nuclear weapons is almost never mentioned by high-level public officials in France. The February 2015 speech by French President Francois Hollande is an exception as he declared that France “... does not want to give up on the goal of disarmament itself, including that of nuclear disarmament” (Hollande 2015, authors’ translation). In 2012, his election as President of the French Republic led some observers to anticipate a change in the French reluctance toward nuclear disarmament, mostly because he was the first left-wing president in seventeen years and that, in a context of austerity, the defense budget was expected to decrease. However, the incoming president had emphasized his continued attachment to French nuclear weapons during the presidential campaign and, once elected, made sure that the false impression would not last by choosing to embark on the most recent French ballistic missile submarine, *Le Terrible*, on July 4, 2012, only a few months after his inauguration. This is symbolically powerful as no French president had made such a visit since Valery Giscard d’Estaing in 1974. In February 2015, President Hollande clearly stated, “The international context does not allow any weakness and shows that the era of nuclear deterrence is not over” (Hollande 2015, authors’ translation). Consequently, we can mostly see continuity between the December 5, 2008 letter by President Sarkozy to the United Nations Secretary-General Ban Ki-Moon about nuclear disarmament, while France was still assuming the rotating presidency of the European Union, and the later practice of President Hollande. The focus of the letter was on the goal of “a safer world” and on measures of arms control and transparency away from immediate

1 nuclear disarmament practice (Sarkozy 2008a). Similarly, Sarkozy had
2 campaigned in 2007 on the idea of being “at odds” (*“la rupture”*) with his
3 predecessors, but his nuclear weapons policy showed demonstrable con-
4 tinuity with the policy followed since the 1970s (Pelopidas 2012).

5 However, the rise of nuclear disarmament advocacy has had a signi-
6 ficant impact on the former policy elites in France and triggered a limited
7 debate in Parliament and among civil society. A 2012 report from the
8 Working Group on the Future of French Nuclear Forces within the Com-
9 mission on Foreign Affairs, Defense and Armed Forces of the Senate
10 noted that:

11
12 ... if we had to design a format of army today starting from scratch, it
13 is very likely that the necessity to acquire a nuclear *force de frappe*, with
14 two legs, would not be part of our ambitions for defense.

15 (French Senate Commission on Foreign Affairs, Defense and
16 Armed Forces 2012)
17

18 This paragraph has had a significant impact, in particular on critical voices
19 against nuclear weapons (Desportes 2014; Quilès *et al.* 2013: 92).

20 Similar to the phenomenon described in the UK, groups mixing per-
21 sonalities from the right and left of the political spectrum have appeared
22 in France and joined forces under the European Leadership Network
23 headed by (now Lord) Des Browne. The only high-level government offi-
24 cial who has been publicly opposed to nuclear weapons for a long time is
25 former French Prime Minister Michel Rocard. He participated in the 1996
26 Canberra Commission and has since then been writing introductions and
27 forewords to books trying to bring nuclear disarmament back into the
28 French debate. In 1996, he wrote a long, partly autobiographical foreword
29 to the French version of the report of the Canberra Commission (Rochard
30 1996) and, in 2009, did the same for the critique of the illogic of the
31 nuclear arms race by Le Guelte (Rochard 2009). In the spring of 2015, he
32 wrote the foreword to the French translation of disarmament advocate
33 Ward Wilson’s book *Five Myths about Nuclear Weapons* (Rocard 2015). As he
34 himself confessed in December 2013, he had been preaching alone in the
35 desert for a long time (Pascallon 2015). However, starting in the late
36 2000s, a French “gang of four” gathered around him (Rocard, Juppé,
37 Richard, and Norlain) and published an article in the French newspaper
38 *Le Monde* (Rocard *et al.* 2009). General Bernard Norlain is a former dir-
39 ector of the Institute for National Defense Studies and was head of the
40 military cabinet for the French Prime Ministers Michel Rocard and
41 Jacques Chirac; Alain Juppé is a former French Prime Minister and Alain
42 Richard is a former Defence Minister. Since then, Alain Richard and Alain
43 Juppé have stayed away from nuclear disarmament advocacy, but former
44 Defence Ministers Paul Quilès (1985–1986) and Herve Morin (2007–2010)
45 have become vocal about the issue. Quilès created an association Arrêter

la bombe [Stop the bomb], along with General Norlain and defense analyst and the French representative of Parliamentarians for Nuclear Nonproliferation and Disarmament Jean-Marie Collin, and later published two books on the issue (Quilès 2012; Quilès *et al.* 2013). A few prominent scientists and public intellectuals joined the discussion, including physicist Albert Jacquard and former diplomat Stephane Hessel (Hessel and Jacquard 2012) and, in a context of austerity, a few military voices advocated the dismantlement of the air leg of the French arsenal, or at least the opening of a serious debate about it (Desportes 2013, 2015). In spite of these differences, we examine in the next section how the political leaderships in the UK and France have maintained a commitment to nuclear weapons.

UK and French commitment to nuclear weapons

The formal UK response to the global zero initiative sparked by Shultz *et al.* (2007) and cemented by US President Barack Obama's speech in Prague in April 2009 (Obama 2009) was generally positive. The validity of a world free of nuclear weapons was accepted and a desire to be at the forefront of developments among the nuclear weapons states was strong, particularly for Labour and the Liberal Democrats.

Nevertheless, the legitimacy of UK nuclear weapons and the practice of nuclear deterrence have not been questioned in Whitehall (Ministry of Defence and the Foreign and Commonwealth Office 2006: 17). None of the main Westminster political parties is committed to relinquishing nuclear weapons. All are committed to replacing Trident in some form and retaining nuclear weapons well into the future, with the Conservatives and Labour committed to a like-for-like replacement of the current system (Coaker 2014; Hansard 2010; Hammond 2013). Anything less than such "essential protection" risks fatally undermining the nation's security, they argue (Robertson *et al.* 2013). The debate led by the Liberal Democrats over possible alternatives is about the more limited aim of rethinking nuclear deterrence to reduce the salience of nuclear weapons, while retaining the capability to deploy them within a specific period of time should a major military threat to the survival of the state ever re-emerge. Successive UK governments have acknowledged that the UK currently faces no major direct nuclear threat and has not faced such a threat since the early 1990s (Cabinet Office 2008: 12). "Unilateralism" remains a dirty word in Westminster after Labour's sojourn into the political wilderness in the 1980s, partly as a result of its electorally unpopular platform of nuclear disarmament (Stott 2006).

What we have witnessed, then, is an aspirational, but conditional, rhetorical commitment to the idea of a world free of nuclear weapons. The commitment is one of working to "create the conditions" for a "step-by-step" approach to nuclear disarmament through multilateral negotiations

1 between the nuclear-armed states (Cabinet Office 2010: 37). In this
2 context, the UK insists that now is not the time for it to get rid of its own
3 nuclear weapons, but to forge ahead with the Trident replacement
4 program. Nuclear weapons are judged to provide a vital insurance against
5 an uncertain future. In fact, necessity and insurance in the face of uncer-
6 tainty is the central theme of contemporary UK nuclear weapons policy. It
7 is a mantra that was developed under Tony Blair and adopted by David
8 Cameron, who has repeatedly asserted that UK nuclear weapons are "...
9 the ultimate insurance policy against blackmail or attack by other coun-
10 tries. That is why I believe it is right to maintain and replace it [Trident]"
11 (Hansard 2011) and that "Trident and its replacement are non-negotiable.
12 They are an absolutely vital part of this nation's security" (Hansard 2015).
13 The UK will therefore retain its weapons for as long as other states possess
14 them and until there is "... global adherence to obligations not to prolifer-
15 ate nuclear weapons or related technology, under the NPT and other
16 treaties and export control regimes" (Ministry of Defence and the Foreign
17 and Commonwealth Office 2006: 15). Furthermore, the UK will only con-
18 sider entering a multilateral nuclear disarmament process after further
19 significant nuclear force reductions by the US and Russia. For example,
20 Alistair Burt, Parliamentary Under-Secretary of State at the Foreign and
21 Commonwealth Office, said:

22
23
24 In order for the UK to offer to include its small number of nuclear
25 weapons in multilateral disarmament negotiations there would first
26 need to be further reductions in the much larger nuclear weapons
27 stockpiles held by other states and greater assurances that no new
28 major threats will emerge that could threaten the UK or its vital
29 interests.

(Hansard 2013)

30
31 Significant *qualitative* changes in UK nuclear weapons policy to comple-
32 ment its post-Cold War *quantitative* force reductions have also been fiercely
33 resisted, such as proposals to de-alert the nuclear arsenal advocated by the
34 Liberal Democrats (Miller *et al.* 2012). Instead, the marker of the UK's
35 commitment to nuclear disarmament has been periodic "salami slicing" of
36 the UK nuclear arsenal. While force reductions are clearly to be wel-
37 come, an exclusive focus on quantitative reductions has sidelined inter-
38 national expectations of the much wider and deeper qualitative changes
39 required to meet Article VI disarmament commitments under the NPT
40 (Ritchie 2014).

41 Nevertheless, the juxtaposition of the global zero agenda with the initi-
42 ation of the Trident replacement process gave some presentational prob-
43 lems for the UK. There is an evident diplomatic tension between
44 commencing the Trident replacement program underpinned by an
45 enduring commitment to the logic of nuclear deterrence and remaining a

firm supporter of the logic of nuclear disarmament in the NPT. The UK has been criticized in the NPT, along with other nuclear weapons states, for the continued modernization of its nuclear weapons and delivery systems because they reinforce the value of nuclear weapons and the practice of nuclear deterrence (Minty 2007). This has made it difficult for the UK government to credibly support a universal norm against nuclear proliferation while insisting that it needs these weapons for its own security for the foreseeable future, particularly when the UK faces no strategic nuclear threat (Ritchie 2007). As Director General of the International Atomic Energy Agency Mohammed El Baradei said in February 2007, the UK cannot "... modernize its Trident submarines and then tell everyone else that nuclear weapons are not needed in the future" (Blair 2007). This criticism has also been leveled at home. Writing in *The Times* in January 2009, three former senior military figures, Field Marshal Lord Bramall, General Lord Ramsbotham, and General Sir Hugh Beach, argued, "The UK does not need a nuclear deterrent" and that:

... it is difficult to see how the UK can exert any leadership and influence on this issue [nuclear disarmament] if we insist on a costly successor to Trident that would not only preserve our own nuclear-power status well into the second half of this century but might actively encourage others to believe that nuclear weapons were still, somehow, vital to the secure defence of self-respecting nations.

(Bramall *et al.* 2009)

The UK has attempted to manage the tension between the two by pursuing a nuclear posture of "minimum deterrence" and demonstrating political leadership on nuclear disarmament. This has required extensive discursive labor to legitimize the long-term retention of nuclear weapons through the expensive recapitalization of Trident system while framing the UK as a nuclear disarmament champion. The 1998 Strategic Defence Review, for example, described this as "... retain[ing] our nuclear deterrent with fewer warheads to meet our twin challenges of minimum credible deterrence backed by a firm commitment to arms control" and "... work[ing] to create conditions in which even a minimum level of nuclear deterrence is no longer necessary" (Ministry of Defence 1998: paras 8 and 55). Colin Gray described it as "... running with the nuclear fox and riding with the disarmament hounds" (Gray 2001: 233). So far, however, the commitment to nuclear deterrence has prevailed to the extent that a like-for-like replacement of Trident remains the path of least political, financial, and operational resistance in Whitehall. Replacing the Trident system is perfectly legitimate under the NPT as far as the UK is concerned (Browne 2007; Ministry of Defence and Foreign and Commonwealth Office 2006: 14).

France's more steadfast defense of nuclear deterrence creates a more limited presentational problem than that observed in the UK even if, as

1 suggested earlier, President Hollande inscribed his defense policy within a
2 framework in which nuclear disarmament remains a long-term possibility.
3 Since the end of the Cold War, the size of the French nuclear forces has
4 diminished significantly to less than 300 warheads and France still wants to
5 appear at the forefront of progress toward a safer world while renewing its
6 commitment to nuclear weapons.

7 After 1995, France stopped nuclear testing, signed and ratified the
8 Comprehensive Test Ban Treaty, and started advocating its entry into
9 force. By 1998, the Mururoa test site in the Pacific, the fissile material pro-
10 duction facilities, and the land-based component of the nuclear forces had
11 been dismantled; the number of ballistic missile submarines permanently
12 at sea was reduced to one and the level of alert of the French nuclear
13 forces was reduced twice. Following the announcement by President
14 Sarkozy in 2008 (Sarkozy 2008b), the size of the air leg of the French
15 nuclear forces has been reduced by one-third. During the 2014 Prepara-
16 tory Committee to the NPT Review Conference, the French Ambassador
17 announced that he would sign the protocol to the Nuclear Weapon Free
18 Zone Treaty in Central Asia and that France was also prepared to sign the
19 protocol to the Southeast Asian Nuclear Weapon Free Zone Treaty
20 (Simon-Michel 2014a, 2014b). Those accomplishments coexist with the
21 modernization of the arsenal outlined above (Journé 2011: 131–138).

22 The two dynamics are articulated via the invocation of an unpredictable
23 and dangerous post-Cold War international context in which nuclear
24 weapons remain the ultimate guarantor of French “vital interests,” both in
25 presidential speeches and in the White Paper on Defence and National
26 Security (French Government 1994: 52; 2008: 69, 315; 2013: 127). The
27 latest instance can be found in Hollande (2015). Already in the military
28 realm in 1994, the preservation of nuclear deterrence was conceived
29 within the framework of “... less immediate risks than before, more diffuse
30 and varied risks, but persisting ones or maybe increasing ones in the fore-
31 seeable period” (French Government 1994: 57, authors’ translation). The
32 2008 White Paper reuses this motif of an increasingly dangerous and
33 unpredictable world (French Government 2008: 11, 14, 300, 315) in which
34 nuclear weapons need to be maintained and modernized. This unpredict-
35 ability opens the possibility of strategic surprises and technological break-
36 throughs. In such a context, the reliance on an air-based component and
37 not only on a submarine-based nuclear force is presented as protecting
38 “... our deterrence against [...] an unexpected technological break-
39 through in the fields of air defense, missile defense or submarine detec-
40 tion (French Government 2008: 169–170, authors’ translation). Here we
41 can see similar justificatory narratives in the UK and France rooted in
42 uncertainty, necessity, and insurance metaphors.

43 Most importantly, in France, nuclear disarmament is never isolated
44 from conventional disarmament and the broader security context (Sarkozy
45 2008a, 2008b; Simon-Michel 2014a, 2014b: 3; Hollande 2015). As a result,

disarmament is portrayed as a multilateral and incremental process toward general and complete disarmament and, while France keeps talking about “... exerting its responsibilities when it comes to disarmament” (Simon-Michel 2014a, 2014b), the framework in which this is supposed to be done is within the Permanent 5 process, where the focus is on transparency in the number of warheads and verification. Transparency is then presented as necessary to create the conditions for nuclear disarmament and as a sign of French progressive policies in that matter, but it is also compatible with classic policies of arms control and deterrence (Hollande 2015; Simon-Michel 2014b). From the French official perspective, “... the next logical step of multilateral disarmament” is the negotiation of a Fissile Material Cut-Off Treaty within the Conference on Disarmament (Simon-Michel 2014a: 3, authors’ translation). In the end, a world without nuclear weapons is simply not the end goal; the consistent end goal from the French official perspective remains “... a safer world for all and to create the conditions for a world without nuclear weapons” (Simon-Michel 2014a: 4, authors’ translation) which fundamentally relies on nuclear deterrence in the face of an uncertain future.

The French attachment to nuclear weapons and nuclear deterrence is also visible in the boundaries of what is publicly debated on the issue in France, within the very limited space this debates occupies (see Pelopidas 2015a). Both the pro- and anti-nuclear deterrence camps accept the fact that nuclear deterrence is technologically driven and that there is a “... preeminence of technology over doctrine” (Quilès *et al.* 2013: 14). While the opponents are trying to use this fact as a critique, the pro-nuclear weapons camp regards it as a reality of the sector. Even the former commander-in-chief of the French Oceanic Strategic Force recognized this (Desportes 2014, 2015; Pascallon 2015). This does not mean that France will deploy any nuclear technology, but, as a result, modernization and technological developments never have to be justified by a strategic or doctrinal purpose; they become acceptable as determinants of the national arsenal. Moreover, the limited French debate is not really about nuclear deterrence. It is rather a debate in the name of nuclear deterrence. In spite of the context of austerity, the law defining military programs for 2014–2019, as well as the presidential speeches, emphasize the need for both legs of the French nuclear arsenal to perform its mission of deterrence credibly. In the name of their perpetuation, modernization is presented as necessary (Hollande 2015; French Government 2014). To clarify that the debate on the possibility of limiting the mission of nuclear deterrence to submarines would not have consequences in the next electoral cycle, French Minister of Defense Jean-Yves Le Drian opened a conference in November 2014 to celebrate the fiftieth anniversary of the French Air Strategic Force and restate its continued relevance (Le Drian 2014).

Overall, political elites in the UK and France remain committed to nuclear weapons and, in spite of their diverging degree of public commitment to the

1 goal of a world free of nuclear weapons, both use similar rhetorical strat-
2 egies to negotiate the tensions between the long-term goal of abolition
3 and the continued need for nuclear weapons. In both countries, the policy
4 goal is not to disarm, but to create the conditions for nuclear disarmament;
5 while nuclear weapons keep being portrayed as an insurance against
6 the unforeseeable, minimum deterrence or strict sufficiency are presented
7 as signs that both countries are ahead of others as far as nuclear disarmament
8 is concerned.

10 Identity and fear

11 The UK's desire to play a global leadership role in nuclear disarmament
12 *and* retain nuclear weapons as a major power, highlights the significance
13 of identity in nuclear politics. In fact, the "ontological insecurity" (Mitzen
14 2006) generated by the prospect of becoming a nuclear weaponless state is
15 a core driver of the UK's determination to replace Trident. This is
16 reflected in the party political fear of a partisan attack by the right-wing
17 press for being "weak" on defense if a radical change in UK nuclear
18 weapons policy is pursued. For many, a decision to become a non-nuclear
19 weapons state by not replacing Trident would signal a dramatic downgrad-
20 ing of the UK's "rank" in the international hierarchy of states (Willet
21 2007). The Conservative Mayor of London Boris Johnson declared in Feb-
22 ruary 2015:

23
24
25 If a Labour–Scottish National Party coalition were to junk Trident,
26 Britain would be vulnerable to nuclear blackmail; but it is worse than
27 that. We would suffer a public and visible diminution of global author-
28 ity; we would be sending a signal that we no longer wished to be taken
29 seriously; that we were perfectly happy to abandon our seat on the UN
30 Security Council to some suit from Brussels; that we were becoming a
31 kind of military capon.

(Johnson 2015)

32
33
34 The possession of nuclear weapons has been an important part of the
35 UK's identity in international politics since the late 1940s. Throughout the
36 Cold War this "nuclear" identity centered on Britain's wider self-identity as
37 a major world power, the USA's primary political and military ally, and a
38 vital part of the Western bulwark against the Soviet ideological and military
39 threat. The Soviet Union has long since been consigned to history and no
40 major strategic nuclear threat has emerged to take its place, but the UK's
41 identity as a major power remains firm and the historical association in the
42 UK between major "powerdom" and the possession of nuclear weaponry
43 remains equally strong. As Mark Smith argued in 2005, underneath the
44 many rationalist justifications for the UK's possession of nuclear weapons
45 lies "... a deeper sense that Britain ought to possess nuclear weapons as

part of the currency of being a major power” (Smith 2005: 449). From the mid-1990s, Tony Blair and later Gordon Brown reproduced this identity within a New Labour framework and renewed the long-standing association between Britain’s identity as a major power and its possession of nuclear weapons. The coalition government has continued this theme and reproduced a post-Cold War identity of the UK as a responsible nuclear power deploying purely defensive and therefore benign nuclear arms in support of international peace and stability.

The possession of nuclear weapons reaffirms and, in part, constitutes the collectively held identity of the UK as an interventionist, “pivotal” power and defender of the international community operating alongside the USA through NATO. It reflects a historical narrative originating in the initial acquisition of a nuclear capability and chronicled in detail by Hennessy (2007b). It is a powerful collective identity, the reproduction of which generates a “national interest” in the continued deployment of strategic nuclear weapons. In essence, if we want to be “the UK” according to this collective identity, then we must have nuclear weapons both as a representation of our major power identity and as a means of enabling the UK to act in the world according to this identity. This association suggests an implicit axiom that the UK *is* a nuclear weapons state both in fact and in identity (Ritchie 2012: chapter 5).

This was evidenced in the debate on the referendum on Scottish independence held in September 2014. The Scottish government, led by the Scottish National Party (SNP) has long insisted that “... an independent Scotland would be a nuclear free Scotland. The UK’s nuclear submarines would have to be removed from Scottish waters, encouraging the UK, we hope, to end its dangerous reliance on an outdated nuclear deterrent” (Scottish National Party 2005). In 2012, the SNP’s then-leader Alex Salmond insisted that a nuclear weapon-free status would be written into a new constitution for an independent Scotland and this was set out in the Scottish government’s draft constitution published in June 2014 (Johnson 2012; Scottish Government 2014: 6). The SNP intended to remove Trident by 2020 within the first parliament of an independent Scotland after a general election in May 2016, twenty months after a successful independence referendum (Carrell 2013; Scottish National Party 2014). This caused deep anxiety for the Westminster political and defense establishment in terms of the UK’s capacity to engage in expeditionary warfare, its “special” relationship with Washington, the retention of a sophisticated nuclear arsenal, and the future of its permanent membership of the United Nations Security Council (Blick and Whitman 2013: 7–8). Former NATO Secretary-General and Labour Defence Secretary, Lord George Robertson alarmingly claimed in April 2014 that Scottish independence would leave the UK as:

... a diminished country whose global position would be open to question.... The loudest cheers for the breakup of Britain would be from

1 our adversaries and from our enemies. For the second military power
2 in the West to shatter this year would be cataclysmic in geopolitical
3 terms.... The force of darkness would simply love it

(Robertson 2014)

4
5
6 Vice-Admiral John McAnally similarly insisted in March 2014 that:

7
8 ... our relationship with the United States, our status as a leading
9 military power and even our permanent membership of the UN
10 Security Council would all probably be lost. We would be reduced to
11 two struggling nations on Europe's periphery.

(Graham 2014)

12
13
14 Similarly, the possession of nuclear weapons has been a significant part of
15 the post-Second World War French national identity, which combines an
16 attachment to nuclear power and to nuclear weapons (Pelopidas 2012;
17 Hecht 1998). This attachment is connected to the image of a protective
18 and responsible world power.

19 Beyond claims of adaptation of the doctrine and the capabilities
20 (Bentégeat 2014), nuclear weapons have remained central as a response
21 to the fear of a loss of independence, security, sovereignty, and freedom of
22 action. The four White Papers on Defense, then the White Papers on
23 Defense and National Security published since the creation of French strategic
24 nuclear forces (in 1972, 1994, 2008, and 2013) show this eloquently.
25 While the attempt at nuclear blackmail by the Soviets and abandonment
26 by the USA during the Suez crisis is interpreted in the UK as meaning
27 that, from that moment on, no major intervention abroad would be possible
28 without consultation with the USA, the French remember it as the
29 founding episode justifying a quest for independence via nuclear weapons
30 (Pelopidas 2015b; Heuser 1998: chapter 3). We are not claiming that the
31 Suez crisis changed the priorities toward the development of nuclear
32 weapons, but instead that its memory retrospectively legitimized the
33 course of action already taken in Paris.

34 Being a nuclear weapons state was a significant part of French anti-
35 hegemonic policies and the refusal of the bipolar order during the Cold
36 War (for a typical example, see de Gaulle's discussion with US Ambassador
37 James Gavin on May 26, 1962; French Government 1962). It has largely
38 persisted after the end of the so-called bipolar order. The 2013 White
39 Paper states that "France's strategy has evolved over time. In the 1972
40 White Paper, its chief focus was nuclear deterrence" (French Government
41 2013: 67). Twenty-two years later, after the end of the Cold War, "... the
42 need to possess nuclear weapons in the new strategic context remains polit-
43 ically a major component of the independence of France" (French Govern-
44 ment 1994: 57, authors' translation). The idea is restated and reinforced in
45 the 2008 White Paper, which portrays nuclear weapons as instruments of

deterrence which serve as "... the ultimate guarantor of national security and independence" (French Government 2008: 69, 315, authors' translation 315). Five years later, the meaning is stable, "... nuclear deterrence is the ultimate guarantee of the security, protection and independence of the Nation" (French Government 2013: 73). In the post-Cold War context, independence is still defined vis-à-vis NATO (French Government 1994: 37; 2008: 110, 317, authors' translation; 2013: 20) and vis-à-vis any other actor that that would restrict France's freedom of action. The 2013 White Paper on defense and national security states that nuclear deterrence "... rules out any threat of blackmail that might paralyze [France's] freedom of decision and action" (French Government 2013: 67). The emphasis was similar five years earlier: nuclear deterrence "... is one of the conditions of our strategic autonomy, and of the freedom of judgment, decision and action of the Head of State" (French Government 2008: 69, authors' translation). "Nuclear blackmail" was similarly considered as "plausible" in the 1994 White Paper (French Government 1994: 67, authors' translation) and freedom of action was to be pursued at least in part with nuclear weapons (French Government 1994: 52).

This freedom of action has to do with the ability of France to exert its responsibility as a world power. In the post-Cold War context, this is notably portrayed as an ability to protect its allies. "By its mere existence, French nuclear deterrence [...] contributes to Europe's security" (French Government 2008: 70, authors' translation). The 2008 White Paper on defense and national security adds, within the discussion of France's independence and freedom of action that, "... the Ottawa declaration and the 1999 strategic concept, which recognize the contribution of its forces [...] to the deterrent capability of the alliance" (French Government 2008: 110, authors' translation). In 2013, the idea of a protective relationship vis-à-vis the European and NATO allies as a result of the possession of nuclear weapons is restated in almost equivalent terms: "France's deterrence capability contributes by its very existence to the security of the Atlantic Alliance and that of Europe" (French Government 2013: 72). Indeed, the focus on freedom of action is explicitly linked to and constrained by "... the framework of [France's] international responsibilities" (French Government 2013: 73).

Pressure to disarm unilaterally in the context of the Trident replacement process, the Global Zero agenda, and the Scottish independence referendum presented a major ontological challenge for the UK political elite. This took a new twist after the 2010 NPT Review Conference through the emergence of a "humanitarian initiative" to delegitimize the use and possession of nuclear weapons based on the unmanageable and unacceptable humanitarian consequences of use (Borrie and Caughley 2013). This process has at the time of writing involved three major international conferences on the humanitarian impact of nuclear weapons in Oslo, Norway (March 2013), Nayarit, Mexico (February 2014), and Vienna, Austria (December 2014). The UK declined to attend the first two conferences, but it did attend the

1 Vienna conference, where it rejected the idea of a humanitarian imperative
2 to ban nuclear weapons: “The UK considers that this approach fails to take
3 account of, and therefore jeopardizes, the stability and security which
4 nuclear weapons can help to ensure” (Foreign and Commonwealth Office
5 2014). France did not send representatives to any of the conferences on the
6 humanitarian consequences of nuclear weapons. Its statements during the
7 NPT review process emphasized the need for a step-by-step multilateral
8 approach to nuclear disarmament that recognizes the NPT review process
9 as the only legitimate framework in which nuclear disarmament progress
10 can be made. “Recent initiatives” calling for more urgent action on nuclear
11 disarmament are accused of being counter-productive because they chal-
12 lenge the legitimacy of this framework (Simon-Michel 2014b). France main-
13 tains that its nuclear disarmament record is exemplary and includes such
14 statement in the latest White Paper on defense and national security:

15
16 Since dismantling its nuclear testing site in the Pacific, France has con-
17 tinued to set an example by taking unilateral measures, such as the
18 irreversible dismantling of its installations for producing fissile mater-
19 ials for nuclear weapons. It has indicated that its arsenal includes
20 fewer than 300 nuclear warheads. France was the first country to take
21 these concrete steps towards nuclear disarmament.

22 (French Government 2013: 73)

23
24 The political authority of the humanitarian initiative rests on a world view
25 that privileges human security, the international rule of law, including
26 international humanitarian law applicable in armed conflict, human
27 rights, and a conception of common humanity that underpins rationales
28 for the “responsibility to protect.” The humanitarian focus exacerbates the
29 tension between French and UK identities as a stalwart supporter and
30 defender of these facets of international politics or protective states on the
31 one hand, and states prepared to inflict massive nuclear damage in the
32 name of their own national security on the other. Both the UK and France
33 routinely self-identify as a “force for good” on the international stage and,
34 in doing so, they conflate responsible and civilized state behavior with
35 nuclear defense of the post-Second World War international order. The
36 Global Zero agenda and the humanitarian initiative have challenged this
37 conflation and set the reproduction by the UK and France of a strategic
38 nuclear capability for another generation against the image of responsible
39 statehood in terms of their own value commitments.

41 Opportunities for the UK

42 The Global Zero agenda provided an opportunity for the UK to exercise
43 international leadership by exploring further steps toward a world free of
44 nuclear weapons, but keeping its own nuclear arsenal as part of Margaret
45

Beckett's "disarmament laboratory" concept (Beckett 2007). Yet Whitehall has chosen not to do so in any significant way for a variety of reasons, not least the politics of nuclear identity outlined in this chapter. The opportunity presented in the context of the Trident replacement debate is to rethink "minimum deterrence" by further reducing both the size and operational readiness of the UK's nuclear weapons or by relinquishing nuclear weapons altogether. On the former, the UK could adopt the "preserved deterrence" option outlined in the *Trident Alternatives Review* (Cabinet Office 2013). This was described as:

No deterrent platforms would be regularly deployed but the UK would maintain the ability to deploy if the context changed. The platforms might be deployed without nuclear weapons for training purposes and could conduct conventional duties as long as they could be made available for deterrent duties if required.

(Cabinet Office 2013: 5)

In such a circumstance, the UK would become what William Walker describes as a "disarmament threshold state" with a fully de-alerted nuclear arsenal (Walker 2010: 447).

Such a move would clearly indicate that the UK no longer sees a compelling reason to deploy nuclear weapons for immediate use, but is temporarily retaining these weapons pending global elimination. A de-alerted posture would all but eliminate any intention to use nuclear weapons first in a crisis at short notice, thereby reinforcing political and legal commitments to non-nuclear weapons states and providing a degree of strategic reassurance to other possessors of nuclear weapons. It would signify an important "de-coupling" (Brown 1997: 47) of nuclear weapons from the broad, day-to-day calculus of national security by demonstrating that the UK is prepared to learn to live without nuclear weapons operationally deployed at sea on a permanent basis as a precursor to learning to live without nuclear weapons at all.

The UK could, of course, go a step further and relinquish nuclear weapons altogether. This would represent the most significant case of "deproliferation" to date and a potential turning point in the global nuclear order (Müller and Schmidt 2010). The decision would be of special significance for a number of reasons. First, the development of nuclear weapons originated in London when the Maud Committee first met in 1940 to consider the practicality of a uranium atom bomb, three years before UK scientists arrived at Los Alamos in New Mexico to build the first atomic bombs under the Manhattan Project. Second, the UK is a depository state of the NPT along with the USA and Russia. Third, the UK is one of the original members of the "nuclear club". Finally, such a decision would unambiguously signal the declining utility of nuclear weapons for a still-powerful, influential, and activist country and would represent a clean

1 break between the pernicious correlation between a nuclear capability and
2 permanent membership of the United Nations Security Council (the UK
3 would not lose its seat – it would have to vote itself off to do that) (Walker
4 2007: 167). General Jack Sheehan, former Supreme Allied Commander,
5 Atlantic for NATO and Commander-in-Chief, US Atlantic Command, con-
6 curred in January 2009, arguing, “I think it is entirely possible that the
7 British government, for a lot of good reasons, could do it [relinquish
8 nuclear weapons] and it would lead the world” and have a significant
9 international impact (Sheehan 2009). Others, such as former UK Defence
10 Secretary Liam Fox, have argued that other states would be “utterly under-
11 whelmed by gesture unilateralism” (Hansard 2007).

12 If the UK continues with business-as-usual, however, the prospects for
13 significant progress toward nuclear disarmament begins to look bleak as
14 observers ponder the practicability of a world without nuclear weapons, if
15 even a self-styled “reluctant” possessor of nuclear weapons operating at
16 “minimum” nuclear posture cannot make a decision to radically rethink
17 its commitment to nuclear deterrence when the strategic rationales for
18 retention are so thin, the opportunity costs for the armed forces are signi-
19 ficant, public opinion is ambivalent or hostile to the replacement
20 program, and the commitment to the NPT and a desire to exercise leader-
21 ship on nuclear disarmament is strong. This has been compounded by
22 efforts to revalidate UK nuclear weapons following Russia’s annexation of
23 Crimea and the strategic destabilization of Ukraine. The UK then-Defence
24 Secretary Philip Hammond, for example, stated in March 2014 that, “What
25 those events do show is that we have been right throughout in maintaining
26 the need to continue with a strategic nuclear deterrent as the ultimate
27 guarantor of Britain’s sovereignty and freedom of action” (Hansard 2014;
28 for a convincing critique of the counter-facts that a nuclear-armed Ukraine
29 would prevent the Russian annexation of Crimea, see Rublee 2015).

30 For now, at least, the UK stands at a crossroads. As the WMD Commis-
31 sion’s report *Weapons of Terror: Freeing the World of Nuclear, Chemical and Bio-*
32 *logical Arms* noted:

33
34 France and the UK will have to decide whether it will be meaningful
35 to retain costly nuclear arsenals that were developed for an enemy that
36 no longer exists, in order to meet hypothetical threats against which
37 such weapons are of questionable value. Both countries are now at a
38 crossroads: going down one road would show their conviction that
39 nuclear weapons are not necessary for their security, while the other
40 would demonstrate to all other states a belief that these weapons con-
41 tinue to be indispensable.

(Blix 2006: 90)

42
43
44 The tension between a firm policy of non-proliferation, as expressed by the
45 firm attitude of the French toward Iran (Pelopidas 2012), and a continued

commitment to a small nuclear arsenal as the ultimate guarantor of national security and independence, which is presented as good value for money and relatively risk-free, is also at the heart of the French stance. The usual reaction is to justify the French policy of strict sufficiency by contrasting it with the US–Soviet nuclear arms race and overkill. Nevertheless, the tension remains strong when we consider that the countries suspected of proliferating will not take the USA as an example, but might rather refer to the French anti-hegemonic nuclear politics of the 1950s and 1960s. The absence of debate of this issue in France is also more of a problem than in the UK, but, in both cases, nuclear vulnerability is at best imperfectly recognized; the public is not presented with consistent justifications of the reasons to continue nuclear vulnerability and any relationship between their continued possession of nuclear weapons and sustaining a permissive global environment for nuclear proliferation is vehemently denied.⁴

Notes

- 1 UK strategic forces were formally committed to NATO in the 1962 Nassau Agreement that paved the way for the Polaris Sales Agreement.
- 2 The government's case was set out in detail by the Ministry of Defence and Foreign and Commonwealth Office (2006).
- 3 The notion that nuclear weapons and the practice of nuclear deterrence are an inevitable, necessary, and enduring component of major power stability.
- 4 For this problem in the UK, see Pelopidas and Weldes (2014).
