| Abstract: | <p>This study explores how big data can be used to enable customers to express unrecognised needs. By acquiring this information, managers can gain opportunities to develop customer-centred products. Big data can be defined as multimedia-rich and interactive low-cost information resulting from mass communication. It offers customers a better understanding of new products and provides new, simplified modes of large-scale interaction between customers and firms. Although previous studies have pointed out that firms can better understand customers' preferences and needs by leveraging different types of available data, the situation is evolving, with increasing application of big data analytics for product development, operations and supply chain management. In order to utilise the customer information available from big data to a larger extent, managers need to identify how to establish a customer-involving environment that encourages customers to share their ideas with managers, contribute their know-how, fiddle around with new products, and express their actual preferences. We investigate a new product development project at an electronics company, STE, and describe how big data is used to connect to, interact with and involve customers in new product development in practice. Our findings reveal that big data can offer customer involvement so as to provide valuable input for developing new products. In this paper, we introduce a customer involvement approach as a new means of coming up with customer-centred new product development.</p> | |

ANNALS OF OPERATIONS RESEARCH

Manuscript ID ANOR-D-16-00210R1 entitled "Unlocking the Power of Big Data in New Product Development"

Dear Professor Wamba,

We were pleased to have an opportunity to revise our manuscript entitled “Unlocking the Power of Big Data in New Product Development” (ANOR-D-16-00210R1). This paper explores how big data can be used to enable customers to express unrecognised needs. It shed interesting insights on how managers could harvest big data to gain opportunities to develop customer-centred products.

In revising the paper, we have carefully considered your comments and suggestions, as well as the reviewer. As instructed, we have attempted to succinctly explain changes made in reaction to all comments. Please find enclosed the revised version of the manuscript *ANOR-D-16-00210R1*. We have made modifications to the paper in order to address the suggestions made by the reviewer.

In addition, we reply to each comment in point-by-point fashion. We outline the modifications in the following pages. We look forward to further feedback to make the paper suitable for publication in the AOR Journal.

Yours sincerely,

The Authors

SUBMISSION ANOR-D-16-00210R1 MODIFICATIONS

The paper has undergone substantial revision and rewriting to incorporate the comments and suggestions of the reviewer. The reviewer's comments were very helpful overall, and we appreciate the very insightful and constructive feedback in response to our original submission. What follows is our point-by-point response to that feedback.

Reviewer #1

1. In this paper, there are many brief explanations of the basic data and the results, but most of them are lack of data analysis, especially in the fifth and sixth chapters. It will be better to add some introductions to the method how to obtain the data, how to analyze and how to draw the conclusions.

R1#1. We would like to thank the reviewer for pointing this out. The main focus of this study is to investigate the approaches for utilising big data in new product development. Because the real company situation is more than complicated, for different companies, they have different objectives, R&D focus, big data technology, available data and so on. Therefore, it is extremely difficult (and meaningless) to provide specific big data analytics for particular NPD project. More importantly, the feedback from the industrialists indicate that most of the companies already have their own big data analytics and technologies. Therefore, instead of conducting a specific big data analysis, this research explores the approaches that could support organisations tap into new ideas captured from big data to facilitate their customer involvement in NPD.

In short, the paper is not a data analytic study and we have avoided this confusion in the revision by better positioned our paper. At the meanwhile, we have added more detailed explanations to the methods how the case company obtain and deal with the data. Please refer to section 5.0 and 6.0, on pages 9-21 (section 5.1, paragraph 1, on page10; section 5.2, paragraphs 1-2, on page 12; section 5.3, paragraphs 1-2, on page 14; section 5.4, paragraphs 2-3, on pages 14-15; section 6.0, paragraph 2, on page 18). Additionally, we have added further explanations in section 6.3 (limitations and future research) to make this clearer, please see paragraph 1, on pages 20-21.

2. It is hard to convince people that the sweeping generalizations are used without the data contrast, especially when you referred to the four stages in the fifth chapters. The real data and analysis are necessary.

R1#2. Noted. In the revision, we have improved the four stages in section 5.0 through providing further explanations to the methods STE Company applied in obtaining and analysing the data. Please see section 5.1, paragraph 1, on page10; section 5.2,

paragraphs 1-2, on page 12; section 5.3, paragraphs 1-2, on page 14; section 5.4, paragraphs 2-3, on pages 14-15 for detailed information.

3. In the fourth chapter, many features of the company are introduced without mentioning the problems it has meet. It will be better to add the analysis of the situations of the company; it will increase the results' conviction in the fifth and sixth chapters.

R1#3. The two challenges in NPD faced by the case company are: 1) The company has stated that its main customers are patients in old age; the product can help doctors intervene earlier and avoid complications. However, since this market size is comparatively small and most doctors are not familiar with the product, sales were decreasing year by year; and 2) In addition, STE experienced challenges with a lack of understanding and customer empathy on the part of its engineering staff. Thus, in order to improve its market performance and gain competitive advantage, the company decided to innovate and to launch new products with improved functionality and a different market focus. Please refer to section 4.1, on page 8.

4. In general, the whole paper should strengthen the key points and focuses more on the methodology instead of the introduction of the results.

R1#4. We believe that we have addressed this issue in comments 1-3. In particular, we have paid more attention on the methodology and further explained how the case company capture and analyse the data to support their NPD. Please refer to section 5.0, on pages 9-17 for detailed information.

As noted earlier, we thank all of the reviewers for their constructive feedback, and hope that they agree that our revisions have addressed their concerns and, in so doing, improved the paper.

Yours sincerely,

The Authors

Unlocking the Power of Big Data in New Product Development

Abstract

This study explores how big data can be used to enable customers to express unrecognised needs. By acquiring this information, managers can gain opportunities to develop customer-centred products. Big data can be defined as multimedia-rich and interactive low-cost information resulting from mass communication. It offers customers a better understanding of new products and provides new, simplified modes of large-scale interaction between customers and firms. Although previous studies have pointed out that firms can better understand customers' preferences and needs by leveraging different types of available data, the situation is evolving, with increasing application of big data analytics for product development, operations and supply chain management. In order to utilise the customer information available from big data to a larger extent, managers need to identify how to establish a customer-involving environment that encourages customers to share their ideas with managers, contribute their know-how, fiddle around with new products, and express their actual preferences. We investigate a new product development project at an electronics company, STE, and describe how big data is used to connect to, interact with and involve customers in new product development in practice. Our findings reveal that big data can offer customer involvement so as to provide valuable input for developing new products. In this paper, we introduce a customer involvement approach as a new means of coming up with customer-centred new product development.

Keywords: *big data; customer involvement; new product development; case study*

1.0 INTRODUCTION

Today, the absorption of external knowledge has become crucial for firms' product innovation (Chao-Ton et al., 2006; Roberts and Candi, 2014; Chuang and Lin, 2015; Lichtenthaler, 2016). In the era of "open innovation", scholars, specialists and researchers plead for much more active participation of customers in new product development (NPD) than is seen with traditional market research (von Hippel, 2002; Chesbrough, 2006; Prahalad and Ramaswamy, 2004; Sarin and O'Connor, 2009; Williamson and Yin, 2014). To uphold the pace of innovation – as is necessary in a world of swiftly varying technologies and customer needs – West et al. (2014), Roberts and Candi (2014), and Füller et al. (2014), among others, have proposed integrating customers into value creation and utilising customers' acquaintance to reinforce a firm's key competences (Gawer and Cusumano, 2014)

1 as well as to comprehend their needs (Dahan and Hauser, 2002; Blazevic and Lievens, 2008;
2 Bharadwaj et al., 2012). As a consequence, novel approaches are required to ensure the active
3 integration of customers into NPD (Bharadwaj et al., 2012; Cooper, 2014). It is, after all, only
4 the customers themselves who are able to evaluate whether they like a new product and
5 whether it fills a previously unmet and quite possibly unrecognised need (Franke et al., 2009;
6 Noble et al., 2012, Roberts and Candi, 2014).
7
8
9

10
11
12 This situation is reinforced by the increasing amounts of data available to business and the
13 associated data-driven efforts at innovation, by new information and communication
14 technologies, as well as by new business models and organisational forms (Wamba et al.,
15 2013; Bharadwaj and Noble, 2015). According to IBM (2013), 90% of the data that exists in
16 the world today was generated in the last two years and it is expected the global total of data
17 will reach 35 zettabytes (ZB) by 2020 (Wong, 2012; Gantz and Reinsel, 2012). This is
18 therefore the era of “big data” (McKinsey, 2011; IBM, 2013; Chan et al., 2015). A key
19 competitive advantage in today’s rapidly changing business environment is the ability to
20 extract big data to gain helpful business insights (Wong, 2012; Tan et al., 2015). Being able
21 to use big data allows firms to achieve outstanding performance against their competitors (Oh,
22 2012). For example, retailers can increase their operating margins by 60 percent through
23 tapping into ‘hidden values’ in big data (Werdigier, 2009).

32
33
34
35

36 Although large amounts of both capital and time may be required to build a big data platform
37 and to install the necessary technologies, the long-term benefits provided by big data are vast
38 (Terziovski, 2010; Song et al., 2016). Studies show that big data plays a critical role in
39 customer involvement. Many researchers point out that firm can better understand customers’
40 preferences and needs by leveraging the data available through loyalty cards and social media
41 (Bozarth et al., 1998; Tsai et al., 2013; Wamba and Carter, 2014). Big data can be defined as
42 an interactive and large-scale information source resulting from low-cost mass
43 communication (Urban and Hauser, 2004; Dahan and Hauser, 2002; Tan et al., 2015). It
44 allows customers to better understand new products and provides simplified methods of
45 multi-media rich interaction between customers and managers. A number of big data
46 analytics and techniques can be found in the literature that relate to customer interaction (Yiu,
47 2012; Zikopoulos and Eaton, 2011; Tan et al., 2015). However, to the best of our knowledge,
48 there is a lack of empirical studies that shed light on how to enhance customer involvement
49 by using big data in practice. The current study mainly argues that there are huge potential

1 values of big data that remain uncovered in new product development (LaValle et al., 2011;
2 Davenport, 2013; Robert and Candi, 2014; Tan et al., 2015). In order to fulfil the gap, it leads
3 to the following research questions concerning NPD:
4

- 5 1. How can customer involvement be improved via big data?
 - 6 2. How can a firm interact with its customers and involve them in the NPD process?
- 7
8
9

10 To answer these questions, this study is organised as follows. First, this study provides an
11 overview of the challenges associated with the recent evolution of approaches to customer
12 involvement. Secondly, we point out that by means of big data, customer involvement can be
13 summarised in a three-phase NPD approach which enables customers share their desires and
14 previously unknown needs through trial-and-error loops. Thirdly, we conduct a longitudinal
15 case study to illustrate how big data can be used to involve customers in NPD in practice.
16 Finally, this paper discusses the implications of using big data to support customer
17 involvement in NPD, discusses the limitations of this investigation, and offers some
18 suggestions for future research.

29 **2.0 CUSTOMER INVOLVEMENT**

30 Companies have gradually been forced to reconsider their basic approach to the creation and
31 marketing of new ideas (Urban and Hauser, 2004; Cooper, 2011; Barwise and Meehan, 2012).
32 Traditional R&D has been considered costly and vague (Pralhad and Ramaswamy, 2013;
33 Steinfeld and Beltoft, 2014). Customer involvement has been extensively employed in
34 management rhetoric as an approach to stiffening the feedback loop between expenditure and
35 production cycles (Urban and Hauser, 2004; Roberts and Candi 2014). Among such
36 perceptions is the assumption that customers are important sources of information and
37 knowledge (Rothwell et al., 1994; Ortt and Duin, 2008; Cooper, 2016), and it is
38 acknowledged that customer involvement can improve NPD (Cooper and Kleinschmidt, 2011;
39 Chang and Taylor, 2016).
40

46
47
48
49
50

51 Tan et al. (2015) recently investigated how some firms are able to determine their customers'
52 needs and then innovate to meet those needs. Such companies are considered to be much
53 more profitable than others (Cooper and Kleinschmidt, 2011; Wong, 2012; Chan et al., 2015).
54 These champions of innovation are able to merge their ambitions and key abilities with their
55 customers. Accordingly, a strong market orientation and the capability of managers to acquire
56 customer needs are perceived as significant reasons for the development of new products
57
58
59
60
61
62
63
64
65

1 (IBM, 2013; Steinfeld and Beltoft, 2014; Chong et al., 2015). For example, in the software
2 industry, customer involvement through new techniques and methods has become popular.
3 Bosch-Sijtsema and Bosch (2015) described ‘agile’ software developments, where customers
4 are actively engaged in designing software and pooling resources with the development teams.
5 Previous literature has demonstrated how firms are able to benefit from teaming up with
6 customers or from acquiring customers’ feedback and input (Brown et al., 2002; Narver et al.,
7 2004; Franke et al., 2009; Bharadwaj et al., 2012; Noble et al., 2012; Cooper, 2014). Such
8 methods and techniques come from both marketing research and R&D. They centre on three
9 key phases in the NPD process: prospect identification; development; testing and product
10 launch (Can Kleef et al., 2005; Zhan et al., 2016). Many studies have looked principally at
11 the theoretical and early NPD phases (Schaarschmidt and Kilian, 2014; Van Kleef et al.,
12 2005). For example, as determined in the PIMS/IMD Brand Innovation Study, growth rates
13 and market share are higher if customers’ assessment of the value of a new product is
14 ascertained in the initial phases of NPD (Kashani et al., 2000). As a result, approaches are
15 required that permit the active involvement of customers in NPD (Füller et al., 2007;
16 Markillie 2012; Roberts and Candi, 2014). Only if customers are able to better comprehend a
17 new product will they be able to sensibly evaluate whether or not they like it and whether it
18 fulfils a latent (and possibly hitherto unrecognised) need. Companies that are able to
19 recognise customers’ latent needs and to have this data inform new product features or entire
20 products will be much more likely to develop successful novel products (Sarin and O’Connor,
21 2009; Roberts and Candi, 2014). As long as managers are able to identify the needs of
22 customers, they will be capable of creating enhanced, customer-centred new products
23 (Mckinsey, 2009; Noble et al., 2012; Bharadwaj and Dong, 2014).
24
25
26
27
28
29
30
31
32
33
34
35
36
37
38
39
40
41
42
43

44 Nonetheless, there are challenges in involving customers in the development of new products
45 and services (Nambisan, 2002; Lundkvist and Yakhlef, 2004; Sashi, 2012; Bowden et al.,
46 2015). As pointed out by Nambisan (2002), one key challenge is simply to get in touch with
47 customers in an effective way. As suggested by Füller et al. (2007), information related to
48 customers’ needs is often costly for product managers to capture. Customer incentives,
49 company identification and socialising are vital for customers to have their knowledge shared
50 with NPD managers (Roberts and Candi, 2014). As stated by Janssen and Dankbaar (2008),
51 customer involvement leads to a superior product, but they argue that further insight is
52 necessary, from diverse sources, as a way of acquiring and analysing customer inputs.
53 Nambisan (2002) states that customers’ motivations to contribute includes outcome control
54
55
56
57
58
59
60
61
62
63
64
65

1 and enhanced self-esteem, while Antikainen et al. (2010) point out that community
2 coordination and entertainment are additional factors. According to Nambisan (2002),
3 engaging customers as NPD co-creators can result in greater project uncertainty, as so
4 requires additional evaluation and control. In addition, customers may frequently require
5 extra knowledge regarding the technology and product under assessment, resulting in a
6 likelihood of customer training costs.
7
8
9

10
11
12 In short, the critical issues in customer involvement concern its cost-effectiveness, how to
13 structure customer input, and how to achieve a broad representation of the customer base.
14 This research aims to overcome these challenges by unlocking the power of big data. In the
15 following section, we introduce the concept of big data, which can be used to improve
16 customer involvement and enable managers to capture customers' explicit and implicit
17 knowledge to support NPD.
18
19
20
21
22
23
24

25 **3.0 BIG DATA IN NEW PRODUCT DEVELOPMENT**

26
27 Today, technology has turned the average customer into an incessant generator of both
28 transactional, traditional, structured data as well as more contemporary, unstructured,
29 behavioural data (Wong, 2012; Bauer and Leker, 2013; Wamba et al., 2015). The magnitude
30 of the data generated, the relentless rapidity at which data is constantly produced, and the
31 diverse richness of the data are transforming NPD and decision making. This is therefore the
32 era of "big data" (Wong, 2012). Big data is characterised by its 3V characteristics (volume,
33 velocity and variety) and can be generated through different information systems and
34 technologies, including smartphone applications, online communities, sensor networks,
35 internet clicks and social media platforms (McAfee et al., 2012; Chan et al., 2015). By
36 studying the literature, we have identified three phases that big data can be used to support in
37 NPD: generation of ideas and concepts; design and engineering; and test and launch.
38 Potential roles and tasks that can be transferred to customers are demonstrated in each of
39 these phases.
40
41
42
43
44
45
46
47
48
49
50
51

52 **3.1 Generation of ideas and concepts**

53
54 The initial phase is centred on the recognition and creation of opportunities, novel ideas and
55 new product concepts (Can Kleef et al., 2005; Cooper, 2014). Big data can be engaged in
56 supporting this phase through the collection of huge amounts of external information to offer
57 managers supportive product ideas (Gantz and Reinsel, 2012; Tsai et al., 2013). Noteworthy
58
59
60
61
62
63
64
65

1 here is the group of inventive customers categorised as ‘lead users’ (Bharadwaj et al., 2012).
2 The information generated can be incorporated in proposals from the firm’s NPD teams
3 (Davenport, 2009; Füller et al., 2014). For instance, Lenovo set up a competition for its
4 customers that involved online services, telematics as well as future PC online assistance
5 systems (Moorhead, 2015). Novel ideas generation by the customers has been endorsed by an
6 interactive multimedia tool for services, as well as assessing ideas generated by others.
7 During the initial phase of NPD process, big data enables the integration of customers and
8 turns them into valuable sources to support companies in ideas generation and evaluation
9 (McAfee et al., 2012; Tsai et al., 2013).
10
11
12
13
14
15
16
17

18 3.2 Design and engineering 19

20 In the design and engineering phase, the term ‘co-creator’ (Dahan and Hauser, 2002; Shu-
21 Chuan and Kim, 2011; Roberts and Candi, 2014) indicates the customer’s role more precisely.
22 Six web-based approaches have been proposed by Dahan and Hauser (2002) that seek the
23 engagement of the Internet users in an enhanced approach than the conventional market
24 research approaches. For instance, a web-based approach can enable customers to design
25 individual products that will meet their particular needs and wants (Schaarschmidt and Killan,
26 2014).
27
28
29
30
31
32
33

34 With such techniques, the advantage of using big data in customer involvement (assessed
35 against conventional market research) is that customers are not only asked about their needs,
36 opinions and wants. They can, rather, exhibit their creativity and competence by deriving and
37 assessing new product ideas; they can challenge, explain and enhance detailed solutions; they
38 can identify and individualise virtual prototypes, experimenting with and embracing the novel
39 product features (Blazevic and Lievens, 2008; Hoyer et al., 2010; Zhang et al., 2011; Chen et
40 al., 2012). This can be achieved by conducting simulations, or by acquiring information from
41 different sources regarding a novel product (Chen et al., 2012; Füller et al., 2014). For
42 instance, Chow Tai Fook Company (a Chinese company engaged in diversified businesses
43 such as jewellery, property and casinos) instituted an internet-based design and launch
44 competition; primarily, customers assessed Chow Tai Fook’s idea of ‘Forevermark magic’, a
45 novel type of jewellery. Subsequently, an internet-based toolkit enhanced customers’
46 individual ‘Forevermark magic’ design. Within a timeframe of a single month, thousands of
47 customers engaged in virtual dialogue and stated their personal preferences. The sampled

1 individuals were able to create hundreds of appealing designs, which motivated Chow Tai
2 Fook's NPD teams in addition to aiding the assessment of customers' latent needs.
3
4

5 3.3 Test and launch 6

7 In the test and launch phase, big data allows companies to transfer individuals from different
8 sources (e.g. web-based communities, websites and platforms) into the roles of end customers
9 or buyers (McKinsey, 2011; McAfee et al., 2012; Wong, 2012; Wamba et al., 2015). Previous
10 studies have illustrated how customers can represent important resources for a company's
11 development of new products and services (Payne et al., 2008; Blazevic and Lievens, 2008;
12 Hoyer et al., 2010; Ahmad et al., 2013; Cooper, 2014). Conventional, manufacture-centric
13 innovation greatly limits the role of the customer (Wong, 2012). For instance, previously
14 customers (termed 'eventual evaluators') were often used to support companies in fixing bugs,
15 (Brown et al., 2002; Fuchs and Schreier, 2011). Otherwise, customers were lucky to have any
16 role at all. In contrast, customers can be seen as co-creators or co-developers in a big data
17 environment (Prahalad and Ramaswamy, 2002; Robert and Candi, 2014). For example,
18 Xuancai Company (a Chinese leading game company), in cooperation with China Telecom
19 (one of the largest telecommunication SOE in China), constructed a customer-friendly online
20 platform (PLAY.CN) to enable customers to compose and download their individual internet
21 mobile java games without any special skills (e.g., programming). Enthusiasts of mobile
22 gaming are acquainted with the novel service, platform testing, as well as downloading their
23 self-designed games for their smartphones (Reuters, 2015). As a consequence, more than a
24 million customers have offered their feedback regarding acceptance, usability, intention to
25 play and willingness to pay. In this way, the customers were able to come up numerous
26 improvement ideas for supporting a company's NPD.

45 **4.0 RESEARCH METHODOLOGY** 46

47 An in-depth case study is presented on the use of big data to improve customer involvement
48 by STE, a young but innovative high-tech company, so as to draw lessons for the effective
49 use of big data to improve customer involvement in NPD. A case study is considered a
50 suitable research approach when exploring emerging complex phenomena (e.g., big data
51 adoption and use) in real-life settings (Dyer and Wilkins, 1991; Wamba et al., 2015; Dutta
52 and Bose, 2015). Besides, a case study is considered an appropriate approach when
53 answering research questions such as 'how' and 'why' things are done (Yin, 1994).
54
55
56
57
58
59
60
61
62
63
64
65

1
2 Additionally, the case study approach is recommended for researches where theories are at
3 their formative stage (Eisenhardt, 1989, Yin, 1994).
4

5 4.1 Research settings: a longitudinal case study of STE, an electronics company 6

7 Qualitative sampling, unlike quantitative sampling, tends to be purposive rather than random.
8
9 The choice of informants, episodes and interactions is usually driven by a conceptual
10 question (Miles and Huberman, 1994). We followed Wamba (2015) and conducted a
11 longitudinal case study. In this particular case, one of the authors had the opportunity to step
12 into a project started at STE in which the objective was to design and to develop a new
13 wearable electronic headset. STE is a Chinese SME manufacturer founded in 2007. It is an
14 innovator in wearable medical equipment. The company is best known for its wearable
15 electronic headset, which can be used to monitor brain activity. The brain activity data is
16 streamed to a smartphone or stored in the system. The data is then transmitted in real time to
17 a receiver located up to 10 miles away. The company has stated that its main customers are
18 patients in old age; the product can help doctors intervene earlier and avoid complications.
19 However, since this market size is comparatively small and most doctors are not familiar with
20 the product, sales were decreasing year by year. In addition, STE experienced challenges with
21 a lack of understanding and customer empathy on the part of its engineering staff. In order to
22 improve its market performance and gain competitive advantage, the company decided to
23 innovate and to launch new products with improved functionality and a different market
24 focus.
25
26
27
28
29
30
31
32
33
34
35
36
37
38
39

40 The main objective of the NPD project was to design and develop a new wearable electronic
41 headset with a new virtual reality function for young people to better understand and control
42 their minds. This is a monitoring device in which user will wear it while they are watching
43 videos, searching the Internet or playing games. It provides users with accurate, real-time
44 feedback on the brain activities. In this way, users can have a better understanding of active
45 areas of the brain in different situations, such as relaxation, improved mood and reduced
46 stress. Two main goals for the project were stated by STE:
47
48
49
50
51

- 52 a) Use big data to better understand customer upcoming trends, expectations and
53 preferences, economically and interactively.
54
- 55 b) Gain insights concerning customer perceptions, acceptance and input through big data
56 and customer involvement.
57
58
59
60
61
62
63
64
65

1 The company has its own information department for data collection and management in
2 order to help meet both of these objectives. The project had four main stages: customer
3 profile determination, identification of different information sources, customer involvement
4 design, and customer access and participation.
5
6
7

8 9 4.2 Data collection

10 In this study, data collection covered multiple sources of evidence, which allowed us to
11 increase the validity of our constructs (Yin, 1994). Initially, a retrospective method (Miller et
12 al., 1997) was applied to become familiar with the initial part of the project, when the concept
13 took shape in 2013. To eliminate distortion, only written reports drawn upon in this wave of
14 data collection. Then, starting in 2014, the subsequent data collection included 6 months of
15 research in real time. The aim was to record how researchers worked in the company
16 (Pettigrew, 1990). For this wave of data collection, sources included: semi-structured
17 interviews with key respondents, on-site observations, annual reports, industrial reports,
18 technical or non-technical documents, newsletters, project reports, strategic planning reports,
19 and discussions with the NPD team. One of the authors was actively engaged in project itself,
20 in market research. This meant that every unit of market information was recorded in real
21 time by one of the researchers. In total, 16 semi-structured interviews were conducted, each
22 lasting 1 to 2 hours. The initial interviews were kept broad in scope in an effort to cover a
23 wide range of motivations, decisions and competences. As the research project progressed
24 and the theory was refined, interview questions became more focused, in an effort to ascribe
25 more details to the emerging patterns. STE's CEO championed the project. The STE NPD
26 team consisted of the CEO, NPD team manager, designers, functional specialists, electronics
27 engineers, information analysts, researchers, and a marketing manager.

45 **5.0 FINDINGS**

46 In this section, we will present key insights and lessons learned from the in-depth analysis of
47 the longitudinal case study of STE. The company is currently using big data for improved
48 customer involvement in development of a new product. The term 'big data' in this case
49 refers typically to the following types of data: (a) traditional enterprise data, (b) social media
50 data, and (c) machine-generated/sensor data (e.g. weblogs, cloud files, smart meters,
51 manufacturing sensors, equipment logs).
52
53
54
55
56
57
58
59

60 5.1 Stage 1: Using big data to determine customer profile

1 STE used to have little direct feedback from customers. Only recently did STE start to
2 monitor customer comments on social media about its products. The Company has
3 implemented the product innovation strategy of ‘customer Demand-Orientation’ and analysed
4 customers’ behaviour by machine-style learning using both qualitative and quantitative data.
5 STE Company gathered feedback from their customers as well as partners about their
6 preferences. In order to identify each wearable electronic headset product and generate new
7 ideas, the company collected different source of data such as videos, photos, number of
8 comments and number of followers from the most popular websites (i.e. Amazon, Facebook,
9 eBay) by using Web Page Cleaning, Web Crawler and HTML parsing technologies. It is
10 worth to mention that all these collected information has vast amounts of data where people
11 produce and share every second and most of the information is unstructured data (i.e. photos,
12 videos or social media) which means it cannot easily be put into tables. Moreover, take
13 Facebook posts as an example, the data quality and accuracy are less controllable. Thus, in
14 order to harvest great values from big data, the trustworthiness of the data is a significant
15 issue that Company STE needs to address. The Company pointed out that data quality can be
16 verified by complete and accurate data which includes values and variables relevant to the
17 purpose of collecting them.
18
19
20
21
22
23
24
25
26
27
28
29
30

31
32 Additionally, STE has developed an application which is highly customisable. It allows its
33 partners and customers to upload their ideas and suggestions to facilitate the company’s NPD
34 and the invention of new features. In this way, potential targets were customers with an
35 interest in becoming involved in developing the new wearable device. Some of these
36 customers were highly innovative and able to offer valuable new product ideas. By
37 visualising the big customer data collected in the past three months, early adopters of the
38 high-end wearable device requested functions like Dynamic Streaming Technology,
39 Telematics, Multi-channel Recording, and Voice Control (see Figure 1).

Figure1. Levels of customer involvement for each new product function

By making use of social data, the managers face the challenges to extract the useful information from the terabytes of text data. Different from other data sources, data from social media is no second intent opinion, but the data density is extremely low, i.e. the useful information is buried in the unstructured massive data. In order to unravel the hidden information, data scientist need to adopt some data-mining techniques such as frequency analysis, cluster analysis, and sentiment analysis. For example, customers have a discussion of new ideas of certain functions, a multidimensional scaling diagram (MDS) can effectively illustrate the clustering results of different opinion groups in the discussion (Tse et al., 2016). It is a useful approach to uncover information since people will use similar wordings but sentence different structures to express their ideas. Thus, it is useful to use clustering analysis with MDS diagrams to identify major opinion group from Facebook data. Also, username is another useful 'metadata' to identify gender of the post owner, so it will be easy to investigate different gender group towards the propose NPD ideas. The STE information department had the job of processing different customers' suggested attributes of a new product in parallel. In particular, it applies different conventional data techniques to harvest useful information from big data. For example, Apache Mahout for machine learning algorithms in business, Tableau for big data visualisation, Storm for analysing real-time computation system and InfoSphere for big data mining and integration.

5.2 Stage 2: Using big data to identify information sources

1 STE's information department is able to analyse customer data captured from different
2 sources. STE Company has set up 3 innovation centres and research laboratories. They can
3 acquire huge customers' data source including data of consumption and personal attribute
4 from operators by means of cooperation agreement, so as to broaden channels of data
5 acquisition and acquire data of target customers', which help it to transform advanced
6 technology into competitive advantages. Particularly, social media is a very important data
7 source. For example, the main forum of STE on its official website posts (in different formats)
8 more than 10,000 topics per day, including new product information, announcements,
9 feedback and discussions. In this open community, there are tens of thousands of posts fed
10 back by customers every week, of which some deep reports of product using came into being.
11 By the way of integrating and analysing information of those posts, STE Company can
12 acquire demands information of customers' with low costs and high efficiency, providing
13 innovative ideas for research and development of new products.
14
15
16
17
18
19
20
21
22
23
24

25 The Company emphasised the important big data source from social media that can create
26 relations and provide a better understanding of the customers and their product usage and in
27 that way improve the development. Particularly, 'lead users' can be differentiated from
28 'normal customers' by the information department through RFM analysis which is a data
29 mining technique quantifying customer value by examining how recency, frequency and
30 monetary a customer purchases (Hughes, 1996). The information department analysed the
31 customer information and activities around the STE brand (e.g. platform, communities, apps,
32 and official websites). Figure 2 shows the STE network for customer connection and
33 interaction. STE connects to its customers through a wide range of sources at low cost (e.g.
34 official web forums, mobile apps, website communities). Using the same means, customers
35 can also interact with the company and each other in real-time. The latest product information
36 is updated to these STE sources on a daily basis, partly to attract more customers and partly
37 to gain feedback for further developments. A vast number of these places were cultivated for
38 different interested customers. In this way, the information department can collect a wide
39 range of customer information from different channels and platforms extremely quickly. Data
40 requirements could be different due to different organisations' needs and problems. Then, a
41 number of data pre-processing techniques, including data cleaning, data integration, data
42 transformation and data reduction, can be applied to remove noise and correct inconsistencies
43 from data sets. After that, data mining techniques can be used to help managers generate lots
44 of useful information.

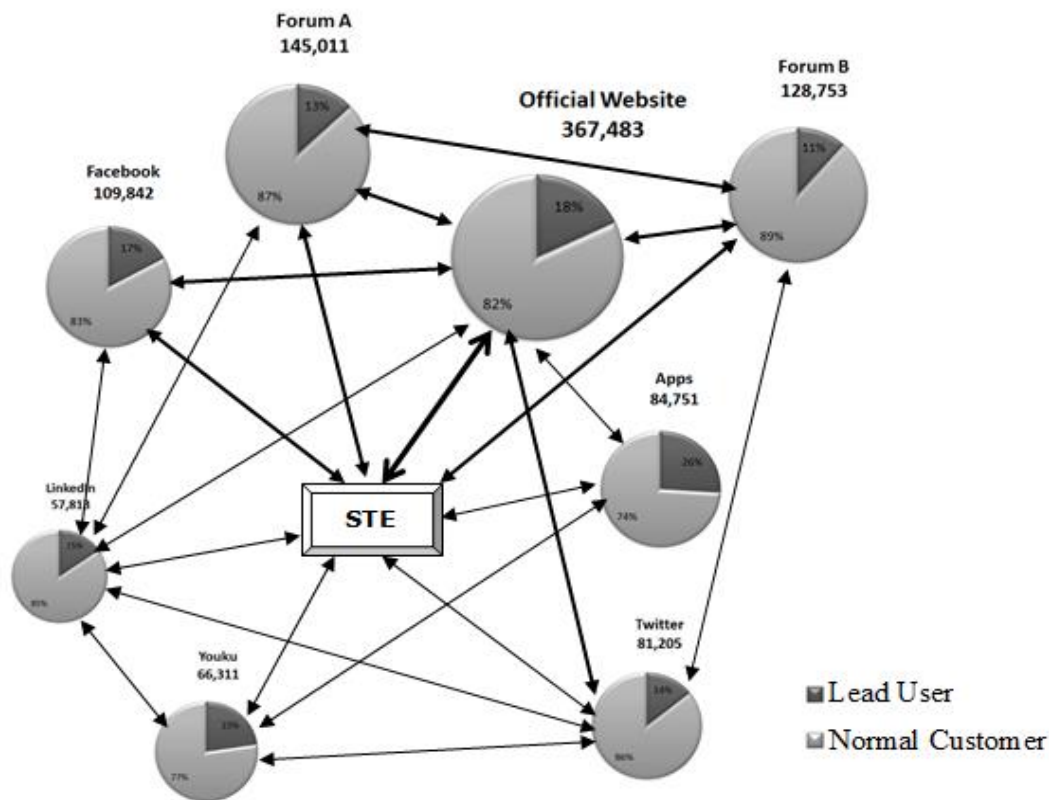

Figure 2: The STE network for customer involvement

5.3 Stage 3: Using big data to improve customer involvement in product design

To come up with a customer involvement process, their individual qualities as well as inspirations should be considered in the design. The best solution to customer involvement is dependent on the specific situation: the offered incentives (e.g. monetary compensation, supply of proprietary information, excitement factor, or even just the kudos of being called a ‘co-developer’); the degree of use of multi-media data (e.g. virtual product presentations, short videos, animations); the intensity of interaction (e.g. duration, frequency and number of participants); the applied tools (e.g. open discussion forums, toolkits, virtual stock markets, virtual concept testing or competitions); and the communication style (e.g. anonymity of the interacting parties, informal/formal; uni-, bi- or multi-directional). In particular, STE Company stalls feedback software and sensors into every new product in combination with the advantages of technology and hardware. According to various data transmitted from customers’ smart devices, functional design to products can be made appropriately so that new product with improved features/functions in line with customers’ demands can be launched. The company has grasped the core big data technology (e.g., Spark SQL, and

1 Hadoop Cluster). Therefore, the companies were able to apply data analytics with its big data
2 technology, and react quickly to acquire a large number of loyal customers through adopting
3 reasonable product portfolio, accurate market orientation and perfect function design. These
4 inputs also allow R&D teams to quickly develop a new version of a product, with improved
5 functions and features.
6
7
8
9

10 The Company explained that customer involvement can be facilitated through utilising big
11 data to provide new or more precise insights. The insights can be gained in a digital form,
12 such as use tests, in order to understand the customers and adjust the decisions about the
13 products accordingly. Therefore, big data allows users' behaviours to be examined and thus
14 their demands can be fitted. Since the recruitment of customers was conducted from diverse
15 information sources, it was imperative for the design to align with corporate identity. In
16 addition to this, the customers were led by the design to share their ideas and expertise in a
17 simple and enjoyable approach.
18
19
20
21
22
23
24
25
26

27 5.4 Stage 4: Using big data to enable customer access and participation

28 In the programming and testing of the customer involvement platform, customers were
29 accessed (communicated with) by different means. The uses of banners, emails, pop-up
30 windows as well as short articles were considered in communicating with the customers
31 encountered in the Internet and notify them on their responsibility in the NPD project. For
32 example, an inviting pop-up window invited every 50th online user to the STE official
33 forums for 1 month. Email and app subscribers were recruited simultaneously.
34
35
36
37
38
39
40
41

42 Within the involvement process, the company connects with its customers through its own
43 Talend big data platform. It understands customers' behaviours and needs better by acquiring
44 datasets from 12 processes that run simultaneously and come from sources including third
45 parties, social networking feeds and Application Programming Interfaces (APIs). The
46 customers were asked for help or raising certain questions with the need for apt processing. A
47 wide range of customers enjoyed giving direct feedback and expressed preferences in NPD.
48 At the meanwhile, customer inputs can be analysed to initiate some improvement and to get
49 first results in case the anticipated quantity or quality of customer information is insufficient,
50 the process of collecting it needs to be reconsidered. Customers engaging with the company
51 for the first time should be assessed for background information on their preferences, their
52 willingness to contribute again as well as their expectations regarding further NPD projects.
53
54
55
56
57
58
59
60
61
62
63
64
65

1 For those customers who have already engaged with the company several times, a
2 relationship can be seen to have been established and company managers should consider
3 creating a specific community for such customers.
4
5
6

7 The role of big data in the NPD process is directly affected by how data-driven the
8 organisation is overall. In particular, as seen at STE Company, their product and solution, as
9 well as product development is highly dependent on the collection and processing of large
10 customer data sets. In order to handle the problem of difficult data storage, STE Company
11 has set up a data centre of cloud computing specialising in storing and handling big data. By
12 means of reconstructing decision making and analysis system based on big data and
13 establishing product innovation and feedback mechanism based on big data and cloud
14 computing, STE Company improved the competitiveness of products and satisfaction of
15 customers. Furthermore, the Company further explained the important of having data
16 centralised in order to provide the ability to all interested actors within the company to access
17 and process it. To organise and manage successfully big data, organisations should have
18 established innovation ecosystem and built “data-alliances” with stakeholders including
19 partners, suppliers and other actors with common interests.
20
21
22
23
24
25
26
27
28
29
30

31 32 33 5.5 Results

34 In the case of STE, overall, more than 26,000 customers had participated in NPD in some
35 form. Over 13,700 new product ideas were recorded from different sources (e.g. images, text,
36 video and voice mails), more than 127,400 comments were made on the specific
37 functionalities required, and over 3,200 visions of future similar devices were gathered. A
38 total of 15,943 customers participated (or around 61.2%) would like to get involved in future
39 NPD projects.
40
41
42
43
44
45
46

47 As suggested by Matzler et al. (1996) and Füller and Matzler (2006), a functional/
48 dysfunctional examination was conducted to identify whether the new functions identified
49 were considered exciting or simply basic. Take the function of Dynamic Streaming
50 Technology as an example, according to the customers’ answers toward the question of how
51 they would react if the Dynamic Streaming Technology (high-quality videos in 360-degree
52 virtual reality) was provided to in the new device and how they would react if the function
53 were not provided, then function/dysfunctional ratios were calculated which evidences
54 whether the new function identified is an excitement or basic factor (Matzler et al., 1996). As
55
56
57
58
59
60
61
62
63
64
65

Figure 3 shows, if Dynamic Streaming Technology were provided it would have a significant impact (0.71) on overall satisfaction with the new device, more so than on dissatisfaction if the function were not provided (-0.39). Therefore, the finding shows that the Dynamic Streaming Technology was identified as an excitement factor, and exceeding customer expectations. If the Dynamic Streaming Technology delivered to the new device it brings excitement, otherwise, there is a low dissatisfaction from the customers.

Figure 3: Dissatisfaction and satisfaction level due to absence or presence of Dynamic Streaming Technology

To examine whether the customer involvement provided by STE actually allows customers to better understand the value of the new products and to articulate their needs, several questions were asked. In particular, a five-point Likert scale (1 = very positive; 2 = positive; 3 = neither; 4 = negative; 5 = very negative) was used to identify the perceptions of customers. The result shows that most of the participated customers highly agreed with the statement that if Dynamic Streaming Technology was supported by the device, its functions and features would meet with satisfaction by customers (Mean = 1.23; Std. Dev. = 0.81). The functionality and interactivity of the information department also helped in the articulation of individual needs and wants (Mean = 1.96; Std. Dev. = 0.94). Overall, customers stated that they positively and actively made contributions to the NPD (Mean = 2.08; Std. Dev. = 0.78).

Engagement with customer-derived big customer data helps STE to understand its customers as well as the market. In this situation, big data supports STE's customer involvement by revealing the factors that might influence customer loyalty (i.e., how to keep customers coming back again and again). By applying big data analytics, STE can identify optimal investment opportunities across different information sources, and keep optimising its marketing strategies through analysis, measurement and testing. The different information and communication technologies applied offer unstructured, semi-structured, and structured

1 input to the R&D teams. In the case study project, structured and large-scale data sets were
2 gathered during the earlier NPD phases, in order to attain more insight into customer contexts
3 and needs, through dialogues, collaboration and online surveys. For example, STE utilises
4 customer dialogue to shape its NPD through customer data capture, crowd-sourcing and large
5 forums. This structured information was often based on customer stories or dialogues, and
6 customers were able to consciously and actively support the development of new products
7 and functionalities. Semi- and unstructured rich data were captured in the later phases of
8 NPD, when a feature or product had been launched on the market, and customers were able to
9 use the particular product or feature. For instance, STE applies natural language processing
10 (NLP) to unstructured content (captured from apps and social networks) to identify customer
11 satisfaction and preferences. The rich data from a variety sources provided a different type of
12 information to the NPD process, and included real behavioural data based on the click
13 behaviour of customers using a system, for example. In such circumstances, the customer was
14 not actively involved in giving feedback, but information was automatically captured through
15 analysing customers' online behaviour. Organisations are paying more and more attention to
16 gathering this type of data, to the extent that discussions are arising in social media about
17 ethics and customer privacy. This is an aspect that requires to be taken into consideration
18 when concentrating on capturing customer data for NPD. Structured, semi-structured and
19 unstructured data are common in customer involvement studies in all phases of product
20 development (Sood and Tellis, 2005; McKinsey, 2009; IBM, 2013; Gantz and Reinsel, 2015).
21 However, in the case study, the data in the first two phases (generation of idea and concepts;
22 design and engineering) are more connected to feedback, while in the later phase of test and
23 launch larger amounts of data are captured through actual use and customer behaviour.

43 **6.0 DISCUSSION**

44 The in-depth case study indicates how big data is used by STE to improve customer
45 involvement in NPD. In particular, customer involvement has to meet both managers'
46 expectations and those of the customers participated. That is, it is necessary to ensure that
47 honest and valuable feedback and input is gained from a diverse body of customers; if they
48 are not provided with some motivation, they will stop contributing or be tempted to provide
49 incorrect information (Füller et al., 2006). From the case study, it is evident that STE, through
50 the use of big data, allows customers not only to embrace inventive products to suggest novel
51 ideas, via trial and error. Apparently, big data enables customers to fiddle around with novel
52 products and new features, which enables them not only to share their tacit knowledge, but
53
54
55
56
57
58
59
60
61
62
63
64
65

1
2 also to articulate their explicit needs. Through its efforts in addressing customers' needs, STE
3 enhances the participation of customer in future company-initiated NPD projects.
4

5 Today, customer expectations are high: they want the latest technology and cutting-edge
6 functionality, but at an unprecedented low price, and immediate services. At the same time,
7 they have little brand loyalty and keep comparing the product with others (Cooper, 2014).
8
9 The proposed customer involvement approach can provide companies with the guidance to
10 handle data from various sources and formats, as well as to push intelligence from these data
11 to various channels so as to support NPD. It is meaningful for development of products and
12 services with short product life cycles, notably in the customer electronics industry and social
13 media applications, where demand is driven mainly by lifestyle trends. STE Company
14 indicates that big data in the customer involvement can lead to a greater understanding on
15 how products or users behave, and enable accurate recommendations for existing or new
16 products. Further, they explained that big data compose a key element of some of their
17 products. In this context, the recommended customer involvement, based on big data, has to
18 support a company's key competencies and be in line with its objectives. On the other hand,
19 it is necessary to balance the expected benefits against potential costs of using big data to
20 interaction with them. Furthermore, the case also highlighted that achieving customer
21 involvement requires considerable coordination and planning through the different NPD
22 phases (Li et al., 2009; Robbins and O'Gorman, 2014). Thus, support from top management
23 through a product champion and tight interfacing with the target market is essential
24 components of customer involvement. In addition, the existing organisational culture (i.e.
25 hierarchical corporate culture) can represent a barrier to firms seeking to capitalise on big
26 data to improve customer involvement. The STE Company referred to the significance of
27 data-driven culture and the impact upon the connected operations. Brynjolfsson and Mc
28 Elheran (2016) explain that in a data-driven culture, data holds a central function and
29 promotes a fact-based decision-making process, while data-driven decisions are more
30 informed and effective (McAfee and Brynjolfsson, 2012). Interviewees from STE Company
31 argued that a data-driven culture is more important than big data technology, since this is
32 where limitations often occur. However, small or young firms are likely to favour the
33 proposed big data supported customer involvement, given their weak inherent 'culture'.
34 Another issue is that not all firms (especially small ones) have adequate infrastructure or
35 professionals to analyse the big data.

6.1 Implications of big data for customer involvement

The benefits of using big data to support customer involvement in NPD are identified as follows: First of all, risk and market uncertainties can be reduced by using big data analytics. Market feedback in a variety of formats and from different sources can be acquired in the early development stages (Wong, 2012; Wamba et al., 2015). Secondly, by harvesting big customer data allows previously unrecognised customer needs or combinations of needs to be identified (Bozarth et al., 1998; Tsai et al., 2013). Market share will go to “first mover” firms that can respond to customers quickly and meet their needs (Hagel and Brown, 2011; Williamson and Yin, 2014). Thirdly, big data can be used to generate great ideas from a variety of sources. Lead customers (or innovative users) often act as co-creators and support NPD managers in developing ‘winning products’ to the market (Trkman et al., 2012; Bauer and Leker, 2013; McKinsey, 2011). Fourthly, big data enables a company to contact potential customers in different ways. Fifthly, it also lends itself to customer loyalty and retention; for example, through online participation in NPD, customers gain a better understanding of a new product but also become attached to the product to which they have made a contribution (McKinsey, 2009; IBM, 2013; Gantz and Reinsel, 2015). It is a compelling experience which creates commitment and trust (Füller et al., 2006; Morgan et al., 2000). Customer involvement in NPD not only improves a company’s product performance, but also serves as a means of building and enhancing relationships with both potential and existing customers (Sirdeshmukh et al., 2002; Tsikriktsis, 2005). Finally, big data can provide NPD teams with a broader basis for their decisions. By applying big data analytics, it is possible to increase the number of test options and to institute parallel testing of product alternatives among a variety of customers; moreover, this can be done repeatedly throughout the different stages of NPD (Terziovski, 2010; Davenport, 2013).

6.2 Implications for research and practice

This study contributes to the big data literature with the development of a customer involvement approach for NPD by unlocking the power of big data. The approach can be applied through all the phases of NPD. In terms of theoretical contributions, this paper extends the traditional NPD boundaries and provides evidence of the vital role of the customer-centred NPD approach in a data-rich environment. Firms are leveraging big data to embed customer sentiment in product development. This enables firms to move away from product-focused innovation and to turn their attention to innovation around the customer experience. The proposed paradigm-shifting customer involvement approach enables firms to

1 find ways to innovate – unlocking the power of big data to improve customer understanding
2 and make NPD faster and less costly. However, the implementation of the customer
3 involvement approach may put considerable strain on an organisation. Nonetheless, we posit
4 that any stress presented by the introduction of the approach will be more than compensated
5 for by the time and cost reductions achieved in the modification of the NPD process.
6
7
8
9

10 This study also contributes to practice. The approach is recommended to NPD managers, as it
11 will allow them to arrange their resources to in order to develop new features and new
12 products in a fast and effective manner. From the examples in the case study, NPD managers
13 can maximise positive outcomes from the approach of customer involvement. In the case of
14 STE, implementing the customer-centred approach allowed it to decrease costs, to increase
15 the speed of NPD and to gain a better understanding of customers' needs (and interaction
16 with customers), and a change in leadership and team organisation. Compared with
17 traditional NPD approach, STE was able to launch a range of new products in less than five
18 months, at a total cost of \$2 million. The company estimate that competitors using traditional
19 design approaches have to invest around \$20 million over twelve months to complete a
20 similar set of NPD. Nonetheless, the challenges STE faced in implementing the customer
21 involvement approach were identified such as IT infrastructure, managing relationships with
22 intermediates, and the culture shift from product focus to customer focus.
23
24
25
26
27
28
29
30
31
32
33
34
35

36 However, managers must also be aware of several vital issues. First of all, the exploitation of
37 customer information may cause intellectual property problems. Secondly, a company's
38 existing NPD programme could be disrupted by the implementation of the new approach.
39 Thirdly, the greater degree of customer interaction is almost certain to mean that competitors
40 will get access to information that would for preference remain secret. Finally, certain
41 knowledge and expertise is needed to meet company's objectives through establishing
42 compelling customer involvement. Therefore, in order to balance potential costs and expected
43 benefits, it is necessary for managers to identify their truly needs from big data and plan the
44 customer involvement approach carefully for specific purpose.
45
46
47
48
49
50
51
52
53

54 6.3 Limitations and future research

55 It is worth to mention that the main focus of this study is to investigate the approaches for
56 utilising big data in new product development. Because the real company situation is more
57 than complicated, for different companies, they have different objectives, R&D focus, big
58
59
60
61
62
63
64
65

1 data technology, available data and so on. More importantly, the feedback from the
2 industrialists indicate that most of the companies already have their own big data analytics
3 and technologies. Therefore, instead of conducting specific big data analyses, this research
4 explores the approaches that could support organisations tap into new ideas captured from big
5 data to facilitate their customer involvement in NPD. In this way, future empirical studies can
6 be conducted at the organisational level to identify the implications of the approach. In
7 particular, relevant business models, strategies, as well as data analytics need to be developed
8 to support the approach. Although the findings of this research focus on a high-tech industry,
9 we believe it can be generalised to any industry that applies big data and employs R&D in its
10 product development and enables their businesses to be connected to the Internet.

11 Additionally, in this research we pay attention to the approach needed to achieve customer
12 involvement via unlocking the power of big data and we found that the approach can also be
13 generalised and applied to other properties of the service or product (e.g. software companies,
14 hospitals or real-estate companies). So far, the development of a high-level approach for such
15 a complicated phenomenon as customer involvement in a big data environment may highlight
16 some obvious connections while failing to capture others. The approach applied is mainly
17 focused on utilising big data to improve customer involvement in NPD, where different big
18 data analytics were applied to support each of the stages. Therefore, the approach may not
19 work where there is no data or data analytics to support it. For effective and efficient
20 customer involvement, certain big data skills and knowledge are necessary. However, not
21 every company may have these specific skills and knowledge and it may prove hard to get the
22 information from the right customers.

40
41
42 As illustrated in this paper, big data plays an important role in enabling companies to come
43 up with genuinely innovative new products. On the contrary, customers facing leading edge
44 problems may spark a company's innovation or NPD process. With this study we intended to
45 provide helpful insights into how big data can be used to enhance customer involvement in
46 developing new products. We are hopeful, though, that this broad approach will offer a
47 means to help integrate the wealth of research on big data and NPD in order to advance both
48 research and practice.
