## 1 $^1\text{H}$ NMR analysis

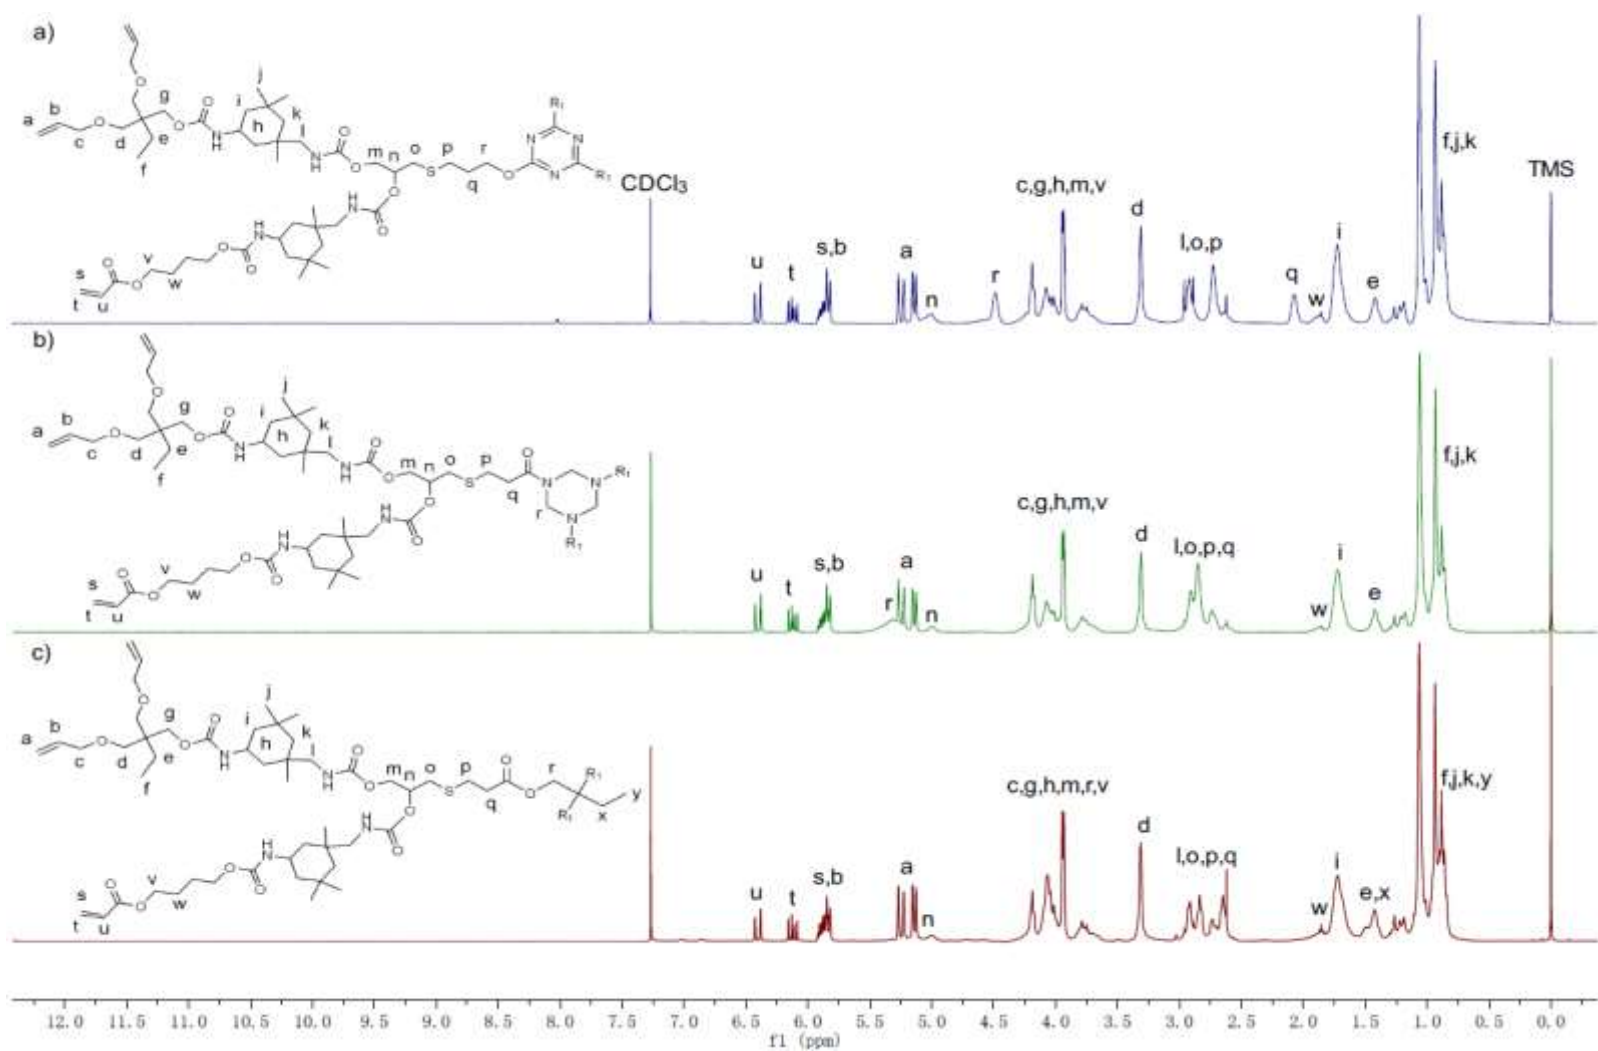

2 For the **Figure S1**, the peaks in the region between 5.2 to 6.5 ppm, corresponding to the alkene or  
3 acrylate protons at the periphery, clearly show that no double bonds are observed. The peak  
4 signals at 4.78 ppm and 4.58 ppm (c, a) can be attributed to the protons of -OH, and the proton  
5 signals at 3.55 ppm, 3.34 ppm (d, b) for -O- $\underline{\text{C}}\text{H}$ -, -O- $\underline{\text{C}}\text{H}_2$ - are observed, respectively. Also, the  
6 thioether hydrogen atoms (- $\underline{\text{C}}\text{H}_2$ -S-) appear at 2.63 ppm and 2.46 ppm (e, f). Moreover, the peaks  
7 at 1.96 ppm (g) and 4.42 ppm (h) are attributed to the protons in - $\text{C}\text{H}_2$ - $\underline{\text{C}}\text{H}_2$ - $\text{C}\text{H}_2$ - and -O- $\underline{\text{C}}\text{H}_2$ -,  
8 respectively, in TAC-MTGL. The peaks at 2.48 ppm (g) and 5.25 ppm (h) are attributed to the  
9 protons in - $\text{C}\text{H}_2$ - $\underline{\text{C}}\text{H}_2$ -CO- and -N- $\underline{\text{C}}\text{H}_2$ -N-, respectively, in TAT-MTGL. The peaks at 2.49 ppm (g)  
10 and 4.00 ppm (h) are attributed to the protons in - $\text{C}\text{H}_2$ - $\underline{\text{C}}\text{H}_2$ -CO- and -C- $\underline{\text{C}}\text{H}_2$ -COO-, respectively,  
11 in TMPTA-MTGL. Through the above analyses, it can be confirmed that TAC-MTGL,  
12 TAT-MTGL and TMPTA-MTGL have been successfully prepared, which is in accordance with  
13 previously reported literatures.<sup>1,2</sup>

14 The  $^1\text{H}$  NMR spectra of HBPUA-TAC, HBPUA-TAT and HBPUA-TMPTA in  $\text{CDCl}_3$  are shown  
15 in **Figure S2**. Clearly, several groups of characteristic peaks at 5.00-6.50ppm (s, u, t, b, a) would  
16 be observed in the spectra, indicating the existence of allyl and acrylate groups in HBPUA-TAC,  
17 HBPUA-TAT and HBPUA-TMPTA (the ratios between allyl groups and acrylate groups is 1:2).  
18 Moreover, some protons have a similar chemical shift due to the similar compositions and  
19 structures of three HBPUA oligomers. The peaks at 0.66-1.12 ppm (f, j, k) are attributed to the  
20 protons in - $\text{C}\text{H}_2$ - $\underline{\text{C}}\text{H}_3$  and -C- $\underline{\text{C}}\text{H}_2$ -C-, the peak at 1.42 ppm (e) is attributed to the protons in  
21 -C- $\underline{\text{C}}\text{H}_2$ - $\text{C}\text{H}_3$ , and the peaks at 1.70-2.00 ppm (i, w) are attributed to the protons in  
22 -CONH-CH- $\underline{\text{C}}\text{H}_2$ -C- and -COO- $\text{C}\text{H}_2$ - $\underline{\text{C}}\text{H}_2$ - $\text{C}\text{H}_2$ -. Additionally, the peaks at 2.52-3.03 ppm (l, o, p)

1 are attributed to the protons in  $-C-\underline{CH}_2-NHCOO-$  and  $-\underline{CH}_2-S-$ , the peak at 3.31 ppm (d) is  
2 attributed to the protons in  $-O-\underline{CH}_2-C-$  and the peaks at 3.58-4.25 ppm (c, g, h, m, v) and 5.01 ppm  
3 (n) are attributed to the protons in  $CH_2=CH-\underline{CH}_2-O-$ ,  $-C-\underline{CH}_2-O-CONH-$ ,  $-O-CONH-\underline{CH}-CH_2-$  and  
4  $-COO-\underline{CH}_2-CH_2-$ . Finally, the peak at 5.01 ppm (n) is attributed to the protons in  
5  $-NHCOO-CH_2-\underline{CH}(CH_2)-O-CONH-$ . The different chemical surroundings of the protons of  
6  $-O-\underline{CH}_2-$  (HBPUA-TAC),  $-N-\underline{CH}_2-N-$  (HBPUA-TAT) and  $-COO-\underline{CH}_2-$  (HBPUA-TMPTA) form  
7 three diverse peak signals at 4.35 ppm, 5.32 ppm and 4.08 ppm for peak r, respectively, are shown  
8 in the spectra. Besides, other characteristic peaks, peak q of HBPUA-TAC and peaks x and y of  
9 HBPUA-TMPTA are also observed, which when combined with other analysis mentioned above  
10 (peak r) indicate that the hyperbranched cores of TAC-MTGL, TAT-MTGL and TMPTA-MTGL  
11 exist in the oligomers.

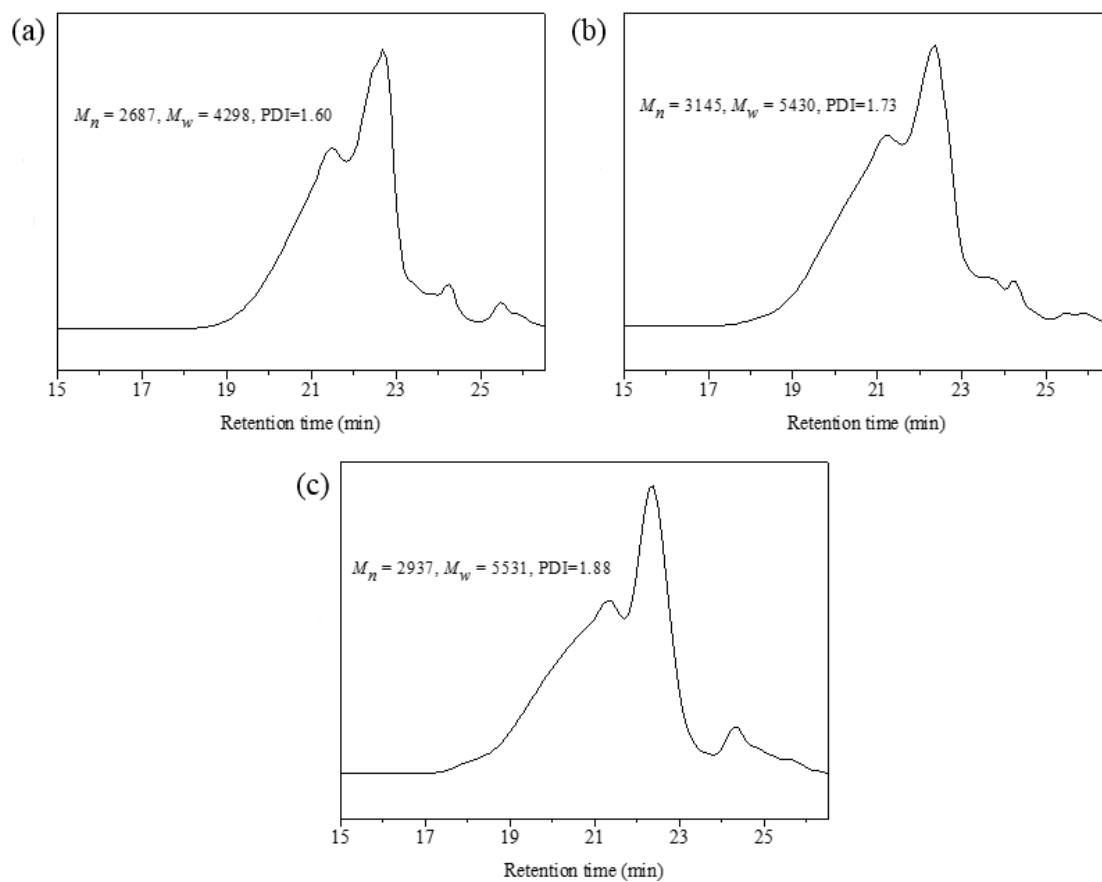

**Figure S1.** <sup>1</sup>H NMR spectra of a) TAC-MTGL, b) TAT-MTGL and c) TMPTA-MTGL.

**Figure S2.**  $^1\text{H}$  NMR spectra of a) HBPUA-TAC, b) HBPUA-TAT and c) HBPUA-TMPTA.

## 1 GPC analysis

2 The molecular weights and polydispersity (PDI) of HBPUA oligomers were analyzed by GPC in  
3 THF, using linear polystyrene standard. From **Figure S3**, there exist two peaks in each GPC curve,  
4 showing that oligomerization during the synthetic reaction was occurred due to the high reaction  
5 temperature. However, because of the self-inhibition in the allyl group, the oligomerization in  
6 HBPUA oligomers tends to form the dipolymer and tripolymer (**Figure S3**). The weight-average  
7 molecular weight ( $M_w$ ) of HBPUA-TAC, HBPUA-TAT and HBPUA-TMPTA are 4298 g/mol,  
8 5430 g/mol and 5531 g/mol, respectively, which are higher than the corresponding theoretical  
9 value (HBPUA-TAC: 2979 g/mol, HBPUA-TAT: 2979 g/mol and HBPUA-TMPTA: 3026 g/mol).  
10 Hence, the PDI of each oligomer shows high value because of the occurrence of oligomerization,  
11 even more than 1.60, indicating that the hyperbranched oligomers are obtained instead of the ideal  
12 dendrimer. The relatively low  $M_w$  of HBPUA-TAC can be attributed to the existence of the rigid  
13 core (triazine ring), which would constrain the chain motion resulting in the reduction of  
14 oligomerization.
