Abstract A nickel catalyst for the allylboration of aldehydes is reported, facilitating the preparation of homoallylic alcohols in high diastereoselectivity. The observed diastereoselectivities and NMR experiments suggest that allylation occurs through well-defined 6-membered transition state, with nickel acting as a Lewis acid.

Key words allylboration, boronic esters, catalysis, homoallylic alcohols, nickel

The use of aryl boron reagents in combination of transition metal catalysis enables wide range of C-C and C-heteroatom bond forming reactions.¹ However, reactions involving the corresponding alkylboronic esters² are underdeveloped despite recent growth in methods to make these valuable reagents.³ Allylboron reagents are a privileged exception, with catalysts based on metals such as palladium,⁴ rhodium,⁵ iridium,⁶ copper,⁷ and cobalt⁸ reported to promote reactions, including cross-couplings and allylboration. In comparison, Ni-catalyzed transformations of allylboron reagents are rare.^{9,10} The ability to develop nickel catalysts which promote the functionalization of alkylboron reagents is desirable. This is both due to nickel's higher abundance and lower cost compared with many precious metals, but also the opportunity to exploit its diverse reactivity in the development of new transformations.¹¹

As part of a programme aimed at the development of metal-catalyzed transformations of alkylboronic esters,¹² we report a Ni-catalyzed allylboration.^{10,13} Previously, isolated allylnickel species have been shown to be nucleophilic, and stoichiometric reactions with aldehydes give homoallylic alcohols as products.¹⁴ Our results also complement reports of Ni-catalyzed reductive allylations of carbonyls¹⁵ and the Ni-catalyzed allylation via double bond transposition of alkenyl borates.¹⁶

We started by investigating the effect of adding Ni(OAc)₂ and a variety of ligands on the yield of allylboration of aldehyde **1a** with boronic ester **2** (Table 1).¹⁷ In the absence of Ni, there was a modest background reaction after 18 h, with 41% yield of homoallylic alcohol **3a** obtained (entry 1). The addition of Ni(OAc)₂ provided little improvement. However, a combination of Ni(OAc)₂ and dppf in a 2.2:1 ratio led to an increased in yield (entry 2). Addition of KF as a base was beneficial (entry 3), though Cs₂CO₃ led to a reduced yield (entry 4). From a survey of ligands, addition of dppf led to the most active catalyst. Other ligand classes including diamines and P,N-ligands led to moderate yields at best (entries 5-9). Using dppf, the loading of catalyst could be reduced. Though 76% of **3a** was obtained within 5 h using 37% Ni(OAc)₂ and 15 mol% dppf, similar yields were only obtained with 12 mol% Ni(OAc)₂ and 5.5 mol% dppf after 24 h. In the interests of reducing the overall cost of reagents, we chose the lower Ni loading to explore the scope of the reaction. These conditions could be scaled up, with 85% of alcohol **3a** isolated as a single diastereomer (entry 10).

Table 1 Evaluation on effect of the reaction conditions on the yield of allylboration.

Entry	Ligand	Base	Yield ^c
1 ^d	-	-	41%
2	dppf	-	70%
3	dppf	KF	84%
4	dppf	CS ₂ CO ₃	45%
5	XantPhos	KF	78%
6	dppbz	KF	82%
7	L1	KF	68%
8	L2	KF	54%
9	PyPhos	KF	52%
10 ^e	dppf	KF	84%

^a 0.044 mmol scale. ^b d.r. determined by ¹H NMR analysis of the crude reaction mixture. ^c yield determined by ¹H NMR analysis using 1,3,5-trimethoxybenzene as an internal standard. ^d without Ni(OAc)₂·6H₂O. ^e 12 mol% Ni(OAc)₂ and 5.5 mol% dppf; 0.33 mmol scale; isolated yield.

Next, we explored the scope with respect to the allylboronic ester reagent (Table 2). *E*- and *Z*-crotyl boronic esters reacted to give the *anti* and *syn* homoallylic alcohols **5a** and **5b** respectively. This is consistent with allylboration occurring through a well-defined cyclic transition state. In both cases, the *E/Z*-ratio of the allylboron matched the d.r. of the product. This suggests that isomerisation of the allyl nucleophile does not occur on the time scale of the reaction. Further boronic esters tested included aryl chloride **4c** and 2-substituted boronic ester **4d**, both of which reacted smoothly. The reaction of trisubstituted allyl boronic ester **4e** demonstrated that formation of a quaternary centre is possible, and that 1,3-allylic transposition does not occur prior to allylation.

Table 2 Allylboration of primary and secondary boronic esters^a

		65%	4:1
		99%	>19:1
		89%	>19:1
		95%	n/a
		79%	n/a
		69%	>9:1
		75%	1:3 (E/Z)
		76% ^d	9:1 (E/Z)

^a 0.33 mmol scale. ^b Isolated yield. ^c d.r. determined by ¹H NMR analysis of the crude reaction mixture. ^d 0.29 mmol scale. Ar = 4-Cl-C₆H₄

The method was also successful with secondary allylboronic esters **4f-4h** (Table 2). Cyclic boronic ester **4f** reacted to give *syn*-homoallylic alcohol **5f** in high yield as a single diastereomer. Acyclic boronic ester **4g** reacted to give alkene **5g** in a modest 3:1 *Z:E* ratio, consistent with previous allylboration using secondary pinacol allylboronic esters.¹⁸ Instead, **4h** reacted to give the corresponding *E*-alkene **5h** in good stereochemical control. Usually a sterically unhindered allylboron reagent is needed to obtain *E*-selectivity for the homoallylic alcohol product.¹⁹ However, it has been observed previously that aryl-substituted secondary allyl boronic esters react to give *E*-homoallylic alcohols preferentially.²⁰ The *E*-selectivity could be accounted for by Ni acting as a Lewis acid catalyst, as a moderate switch from *Z*- to *E*-selectivity has also been observed using Lewis acid catalysts.²¹

We next explored the scope of aldehydes tolerated in the Ni-catalyzed allylboration. Boronic ester **2** reacted with a range of benzaldehyde derivatives to give *anti*-homoallylic alcohols **3a-3r** in good to excellent yield (Scheme 2). The relative configuration

of **3f** was confirmed by x-ray crystallography.²² The remainder of the products were assigned through comparison with literature data or by analogy to **3f**. Functional groups tolerated include aryl halides, nitrile, nitro, and trifluoromethyl groups. Substitution at the ortho-position position did not lower the reaction efficiency. Heteroaromatic pyridyl-, furyl- and thiophenyl-derived aldehydes also reacted in good yield. The reaction conditions were also successful with aliphatic aldehydes **1q** and **1r**.

Scheme 2 Scope of Ni-catalyzed allylboration with respect to carbonyl electrophile. Reactions were performed on 0.33 mmol scale. Diastereomeric ratios were determined by ¹H NMR analysis of the crude reaction mixture. Isolated yields are reported.

The reaction of (*S*)-**1s** provided homoallylic alcohol (*S,S,R*)-**3s**, the syn,anti diastereomer, which was isolated as a single diastereomer (eq 1). The absolute configuration was confirmed by X-ray crystallography.²² The diastereoselectivity observed (>6:1) is greater than for the corresponding reaction of aldehyde **1s** with boronic ester **4a** as described by Roush and co-workers, which gave a 1:1 mixture of syn,anti and anti,anti products.²³ The syn diastereoselectivity is consistent with a chelate controlled anti-Cram addition to aldehyde (*S*)-**1s**.²⁴

The Ni-catalyzed allylboration reaction could also be carried out on the gram scale without decrease in reaction efficiency (eq 2).

Equation 2 Nickel-catalyzed allylboration on gram-scale.

To give insight to the role of the Ni catalyst, we performed a series of ¹¹B NMR experiments (Figure 1). First we analysed a solution containing Ni(OAc)₂, dppe, KF and boronic ester **2** in THF. A characteristic peak for a boronic ester was observed at 33 ppm. This signal remained unchanged over a 3 h period. Next, 1 equivalent of benzaldehyde was added to the solution and the mixture was reanalysed. Within 30 minutes, a new peak was observed by boron NMR at 22 ppm, which is consistent with a borate, presumably structure **6** formed through allylboration. This suggests that the Ni catalyst is unlikely to undergo transmetalation with the boronic ester, as an AcO-B(pin) by-product was not observed before addition of the aldehyde. Instead, the data are more consistent with Ni acting as a Lewis acid catalyst.

Figure 1 Overlaid ¹¹B NMR spectra for a) boronic ester **2**, b) boronic ester **2** in the presence of the Ni catalyst, c) boronic ester **2** in the presence of the Ni catalyst with aldehyde **1a** added after 3 h.

In summary, we have developed a Ni-catalyzed allylboration of aldehydes with allylboronic esters. The high diastereoselectivities obtained are consistent with allylation occurring through a cyclic transition state. A NMR study suggests that the role of the Ni-catalyst is likely to be as a Lewis acid.

The experimental section has no title; please leave this line here.

All reagents and solvents used were supplied by commercial sources without further purification unless specified. All air-sensitive reactions were carried out under a nitrogen atmosphere using oven-dried apparatus. Anhydrous Et₂O and THF were dried and purified by passage through activated alumina columns using a solvent purification system. All petroleum ether used was 40-60 °C petroleum ether. Thin layer chromatography (TLC) was performed on aluminium-backed plates pre-coated with silica. Compounds were visualised by exposure to UV light or by dipping the plates into solutions of vanillin followed by heating. All flash chromatography was carried out using silica gel mesh 40-63. Infrared spectra were recorded on a Perkin Elmer 100 FT instrument on the neat compound. NMR spectra were recorded on Bruker Avance 400 and 500 instruments at the indicated 101, 128, 126, 377 and 400 MHz as dilute

solutions in the indicated deuterated solvent at ambient temperature. All chemical shifts (δ) reported in parts per million (ppm) relative to residual protio solvent (δ H: $\text{CHCl}_3 = 7.27$ ppm) or the solvent itself (δ C: $\text{CDCl}_3 = 77.0$ ppm). All multiplets are designated by the following abbreviations: s = singlet, br s = broad singlet, d = doublet, dt = doublet triplet, td = triplet doublet, ddd = doublet of doublets of doublets, q = quartet, br q = broad quartet, m = multiplet. All coupling constants (J) are reported in Hertz (Hz). ^{13}C NMR spectra were acquired DEPT-Q experiments as standard; standard ^{13}C NMR experiments were acquired when quaternary carbons were hard to distinguish by DEPT-Q. ^{19}F NMR spectra acquired as decoupled spectra. High-resolution mass spectra were recorded using either electrospray ionization (ESI) or electron ionisation (EI) by the Mass Spectrometry Service at the Department of Chemistry, University of Sheffield. Melting points were measured using Linkam HF91 heating stage, used in conjunction with a TC92 controller and are uncorrected. Single crystal X-ray intensity data was collected at 100 K on a Bruker D8 Venture diffractometer equipped with a Photon 100 CMOS detector using a $\text{CuK}\alpha$ microfocus X-ray source from crystals mounted in fomblin oil on a MiTiGen microloop and cooled in a stream of cold N_2 .

Procedures

1,3,2-Dioxaborolane-4,4,5,5-tetramethyl-2[(2E)-3-phenyl-2-propen-1-yl] (2)

Using a modification of the procedure by Singaram and co-workers,²⁵ a flask containing magnesium turnings (0.583 g, 24.0 mmol) was purged with nitrogen and charged with anhydrous THF (30 mL) followed by $\text{HB}(\text{pin})$ (3.0 mL, 20 mmol). Cinnamyl chloride (2.8 mL, 20 mmol) was added dropwise over 5 min at room temperature. The mixture was stirred for 1 h, and another portion of cinnamyl chloride (1.4 mL, 10.0 mmol) was added. After 5 h of stirring at room temperature the magnesium turnings were fully consumed. The reaction was diluted with hexanes (20 mL) and quenched with aqueous HCl (0.1 M, 60 mL) (Caution! Hydrogen evolution). The mixture was extracted with hexanes (2 \times 20 mL) and the combined organic layers were dried (MgSO_4), filtered, and concentrated *in vacuo*. The residue was purified by flash chromatography (2% Et_2O /petroleum ether) to give boronic ester **2** (1.29 g, 26%) as a colourless solid. The data were consistent with the literature.²⁶

$R_f = 0.06$ (2% Et_2O /petroleum ether).

$^1\text{H NMR}$ (CDCl_3 , 400 MHz) δ 7.29–7.17 (m, 4H, ArH), 7.12–7.09 (t, $J = 7.2$ Hz, 1H, ArH), 6.30 (d, $J = 15.8$ Hz, 1H, PhCH=C), 6.20 (dt, $J = 15.8, 7.2$ Hz, 1H, PhCH=CH), 1.86 (d, $J = 7.2$ Hz, 2H, CH₂), 1.24 (s, 12H, 4 \times CH₃).

$^{11}\text{B NMR}$ (CDCl_3 , 128 MHz) 32.7.

4,4,5,5-Tetramethyl-2-[(2E)-3-(4-chlorophenyl)prop-2-en-1-yl]-1,3,2-dioxaborolane (4c)

Using a modification of the procedure by Morken and co-workers,⁴¹ an oven-dried flask containing aldehyde (2.00 g, 14.0 mmol) was purged under nitrogen. THF (70 mL) was added and the mixture was cooled to -78 °C. Vinyl magnesium bromide (0.7 M in THF, 25 mL, 17.0 mmol) was added and the mixture was warmed to room temperature and stirred for 3 h. Saturated aqueous ammonium chloride (40 mL) was added, and the mixture was extracted with Et_2O (3 \times 30 mL). The combined organic layers were dried (MgSO_4), filtered, and concentrated *in vacuo* to give 1-(4-chlorophenyl)prop-2-en-1-ol (2.40 g) as an orange oil. The material was used without further purification.

An oven-dried round bottom flask containing 1-(4-chlorophenyl)prop-2-en-1-ol (1.00 g, 6.00 mmol) was purged under nitrogen. CH_2Cl_2 (10 mL) was added and the mixture was cooled to 0 °C. SOCl_2 (1.29 mL, 17.9 mmol) was added, and the mixture was stirred at 0 °C for 3 h and then at room temperature for 2 h. The mixture was quenched with ice water (30 mL), and extracted with CH_2Cl_2 (3 \times 10 mL). The combined organic layers were dried (MgSO_4), filtered, and concentrated *in vacuo* to give 1-chloro-4-[(1E)-3-chloroprop-1-en-1-yl]benzene (1.11 g) as a brown solid. The material was used without further purification.

Using a modification of the procedure by Singaram and co-workers,²⁵ a round bottom flask containing magnesium turnings (127 mg, 5.29 mmol) was purged with nitrogen. Anhydrous THF (15 mL) was added followed by $\text{HB}(\text{pin})$ (0.60 mL, 4.4 mmol). 1-Chloro-4-[(1E)-3-chloroprop-1-en-1-yl]benzene (0.83 g, 4.4 mmol) was added dropwise over 5 min at room temperature. The mixture was stirred for 1 h, another 0.5 equiv of allyl chloride **S2** (0.41 g, 2.2 mmol) was added. After stirring at room temperature overnight the magnesium turnings were fully consumed. The mixture was diluted with hexanes (10 mL) and quenched with aqueous HCl (0.1 M, 30 mL) (Caution! Hydrogen evolution). The mixture was extracted with hexanes (3 \times 10 mL) and the combined organic layers were dried (MgSO_4), filtered, and concentrated *in vacuo*. The crude material was purified by flash chromatography (2% Et_2O /petroleum ether) to give boronic ester **4c** (94.4 mg, 5%) as a pale yellow oil. The data were consistent with the literature.²⁸

$R_f = 0.23$ (2% Et_2O /petroleum ether).

$^1\text{H NMR}$ (CDCl_3 , 400 MHz) δ 7.27–7.20 (m, 4H, ArH), 6.29–6.26 (m, 2H, HC=CH), 1.86 (d, $J = 6.5$ Hz, 2H, CH₂), 1.23 (s, 12H, 4 \times CH₃).

(±)-2-(1-Phenyl-2-propen-1-yl)-4,4,5,5-tetramethyl-1,3,2-Dioxaborolane (4h)

Using a modification of the procedure by Aggarwal and co-workers,³² a Schlenk flask containing benzyl *N,N*-diisopropylcarbamate¹² (1.16 g, 4.97 mmol) was backfilled with nitrogen three times. TMEDA (0.74 mL, 4.97 mmol) and anhydrous Et₂O (12 mL, 0.2 M) were added and the mixture was cooled to -78 °C. *s*-BuLi (1.3 M in hexanes, 3.80 mL, 4.67 mmol) was added dropwise and the mixture was stirred at -78 °C for 4 h. 2-Vinyl-4,4,5,5-tetramethyl-1,3,2-dioxaborolane (0.5 mL, 2.9 mmol) was added dropwise, and the mixture was stirred at -78 °C for 1 h. A solution of MgBr₂ in Et₂O (2.50 mL, 8.77 mmol; freshly prepared from Mg turnings (0.210 g, 8.75 mmol), Et₂O (3 mL) and 1,2-dibromoethane (0.75 mL, 8.75 mmol)) was added dropwise and the mixture was stirred at 34 °C for 18 h. The mixture was cooled to room temperature, and NH₄Cl (20 mL) and Et₂O (15 mL) were added. The mixture was extracted with Et₂O (3 × 15 mL), and the combined organic layers were dried (MgSO₄), filtered, and concentrated *in vacuo*. The mixture was purified by flash chromatography (2% Et₂O/petroleum ether), to give the boronic ester **4h** (451 mg, 64%) as a colourless oil. There is only partial data available in the literature.³³

Rf = 0.20 (2% Et₂O/petroleum ether)

¹H NMR (CDCl₃, 400 MHz) δ 7.31-7.11 (m, 5H, ArH), 6.10 (ddd, *J* = 17.1, 10.2, 8.2 Hz, 1H, CH=CH₂), 5.02-5.00 (m, 2H, CH₂), 3.23 (d, *J* = 8.2 Hz, 1H, ArCH), 1.21 (s, 12H, 4 × CH₃).

¹³C NMR (CDCl₃, 101 MHz) δ 141.1 (C), 138.7 (CH), 128.4 (4 × CH), 125.5 (CH), 114.5 (CH₂), 83.6 (2 × C), 24.6 (4 × CH₃).

HRMS (EI) Exact mass calculated for C₁₅H₂₁BO₂ [M+]: 244.1634, found 244.1629.

General Procedure 1: Preparative Scale Nickel Catalyzed Allylboration.

An oven-dried flask was charged with an aldehyde (0.330 mmol), Ni(OAc)₂·4H₂O (10.0 mg, 0.040 mmol), KF (21.0 mg, 0.390 mmol) and dppf (9.5 mg, 0.017 mmol) and purged under nitrogen for 1 h. Boronic ester (0.390 mmol, 1.2 equiv) and THF (3 mL) was added, and the mixture stirred at room temperature for 18 h. Water (10 mL) was added and the mixture was extracted with Et₂O (3 × 10 mL). The combined organic layers were dried (MgSO₄), filtered, and dried *in vacuo*. The crude material was purified by flash chromatography.

(±)-anti-1-(4-Chlorophenyl)-2-phenyl-but-3-en-1-ol (3a)

The title compound was prepared according to General Procedure 1 from 4-chlorobenzaldehyde (45.3 mg, 0.332 mmol) and boronic ester **2** (99.3 mg, 0.407 mmol). The crude material was purified by flash chromatography (10% Et₂O/petroleum ether) to give alcohol **3a** (70.4 mg, 84%) as a colourless oil. The data were consistent with the literature.³⁴

Rf = 0.18 (10% Et₂O/petroleum ether).

¹H NMR (CDCl₃, 400 MHz) δ 7.25-7.15 (m, 5H, ArH), 7.07-7.03 (m, 4H, ArH), 6.24 (ddd, *J* = 17.1, 10.2, 9.6 Hz, 1H, CH=CH₂), 5.28 (dd, *J* = 10.2, 1.2 Hz, 1H, CH=CH_AH_B), 5.24 (dd, *J* = 17.1, 1.2 Hz, 1H, CH=CH_AH_B), 4.81 (d, *J* = 7.9 Hz, 1H, HOCH), 3.48 (dd, *J* = 9.6, 7.9 Hz, 1H, C=CCH), 2.39 (d, *J* = 2.2 Hz, 1H, OH).

¹³C NMR (CDCl₃, 126 MHz) δ 140.3 (C), 139.9 (C), 136.8 (CH), 129.5 (CH), 128.5 (2 × CH), 128.2 (2 × CH), 126.9 (CH), 125.1 (CH), 119.0 (CH₂), 108.6 (C), 72.4 (CH), 57.9 (CH).

HRMS (ESI) Exact mass calculated for C₁₄H₁₃⁸¹BrOSNa [M+Na]⁺: 332.9742, found: 332.9742.

(±)-anti-1,4-Diphenylhex-5-en-3-ol (3q)

The title compound was prepared according to General Procedure 1 from 3-phenylpropionaldehyde (44.2 mg, 0.329 mmol) and boronic ester **2** (97.3 mg, 0.399 mmol). The crude material was purified by flash chromatography (10% Et₂O/petroleum ether) to give alcohol **3q** (57.2 mg, 69%) as a colourless oil. The data were consistent with the literature.⁴⁵

Rf = 0.23 (10% Et₂O/petroleum ether).

¹H NMR (CDCl₃, 400 MHz) δ 7.32 (t, *J* = 7.3 Hz, 2H, ArH), 7.27-7.22 (m, 3H, ArH), 7.18-7.17 (m, 3H, ArH), 7.12 (d, *J* = 7.0 Hz, 2H, ArH), 6.16-6.07 (m, 1H, CH=CH₂), 5.25 (dd, *J* = 10.2, 1.1 Hz, 1H, CH=CH_AH_B), 5.22 (dd, *J* = 17.4, 1.1 Hz, 1H, CH=CH_AH_B), 3.83-3.76 (m, 1H, HOCH), 3.30-3.26 (m, 1H, C=CCH), 2.88-2.81 (m, 1H, PhCH_AH_B), 2.67-2.59 (m, 1H, PhCH_AH_B), 1.88-1.86 (m, 1H, PhCH₂CH_AH_B), 1.70-1.61 (m, 1H, PhCH₂CH_AH_B), 1.58 (s, 1H, OH).

¹³C NMR (CDCl₃, 126 MHz) δ 142.0 (C), 141.4 (C), 138.3 (CH), 128.7 (2 × CH), 128.4 (2 × CH), 128.3 (2 × CH), 128.0 (2 × CH), 126.7 (CH), 125.7 (CH), 118.0 (CH₂), 73.2 (CH), 57.5 (CH), 36.0 (CH₂), 32.0 (CH₂).

(±)-anti-1-Cyclohexyl-2-phenylbut-3-en-1-ol (3r)

The title compound was prepared according to General Procedure 1 from cyclohexane carboxaldehyde (38.9 mg, 0.347 mmol) and boronic ester **2** (99.6 mg, 0.408 mmol). The crude material was purified by flash column chromatography on silica gel (10% Et₂O/*n*-hexane) to give alcohol **3r** (47.2 mg, 59%) as a colourless oil. The data were consistent with the literature.⁴⁶

Rf = 0.10 (10% Et₂O/*n*-hexane).

¹H NMR (CDCl₃, 400 MHz) δ 7.35-7.32 (m, 2H, ArH), 7.27-7.22 (m, 3H, ArH), 6.15 (dd, *J* = 17.0, 9.7, 8.7 Hz, 1H, CH=CH₂), 5.24-5.18 (m, 2H, CH=CH₂), 3.60-3.58 (m, 1H, HOCH), 3.47 (dd, *J* = 8.7, 7.8 Hz, 1H, C=CCH), 1.83-1.82 (m, 1H, Cy), 1.73-1.59 (m, 4H, Cy), 1.27-1.01 (m, 6H, Cy).

¹³C NMR (CDCl₃, 101 MHz) δ 142.1 (C), 138.4 (CH), 128.7 (2 × CH), 127.9 (2 × CH), 126.5 (CH), 117.7 (CH₂), 78.1 (CH), 53.7 (CH), 39.5 (CH), 30.2 (CH₂), 26.5 (CH₂), 26.4 (CH₂), 26.3 (CH₂), 26.0 (CH₂).

(1S,2R)-1-[(4S)-2,2-dimethyl-1,3-dioxolan-4-yl]-2-phenylbut-3-en-1-ol (3s)

The title compound was prepared according to General Procedure 1 from 2,3-O-Isopropylidene-D-glyceraldehyde 50% w/w in dichloromethane (175.5 mg, 0.674 mmol) and boronic ester **2** (196.6 mg, 0.805 mmol). The crude material was purified by flash chromatography (10% Et₂O/petroleum ether) to give alcohol **3s** (70.6 mg, 42%) as a pale yellow solid.

[α]_D²⁰ +82° (c = 0.22, CHCl₃)

m.p. 54-56 °C (pentane)

IR 3484 (O-H), 2993, 1455, 1221, 1061, 698.

¹H NMR (400 MHz, CDCl₃) δ 7.35-7.32 (2H, m, ArH), 7.26-7.24 (3H, m, ArH), 6.25 (1H, ddd, *J* = 17.2, 10.2, 8.5 Hz, CH=CH₂), 5.21 (1H, d, *J* = 9.6 Hz, CH=CH_AH_B), 5.15 (1H, d, *J* = 17.1 Hz, CH=CH_AH_B), 3.92 (1H, td, *J* = 6.7, 4.8 Hz, 1H), 3.77-3.70 (2H, m, *J* = 14.6, 7.9, 5.8 Hz, 1H), 3.62 (1H, t, *J* = 7.6 Hz, 1H), 3.39 (1H, t, *J* = 8.1 Hz, 1H), 2.31 (1H, d, *J* = 5.8 Hz, OH), 1.44 (3H, s, CH₃), 1.31 (3H, s, CH₃).

¹³C NMR (101 MHz, CDCl₃) δ 140.8 (C), 138.1 (CH), 128.7 (2 × CH), 128.3 (2 × CH), 126.9 (CH), 117.2 (CH₂), 109.1 (C), 76.5 (CH), 74.4 (CH), 66.1 (CH₂), 54.1 (CH), 26.5 (CH₃), 25.3 (CH₃).

HRMS (Q-TOF) Exact mass calculated for C₁₅H₂₀O₃[M+H⁺]: 249.1446, found 249.1485.
