Version: Supplemental Material

Article:

Zhou, W., Liu, G., Hung, R.J. et al. (29 more authors) (2021) Causal relationships between body mass index, smoking, and lung cancer: univariable and multivariable mendelian randomization. International Journal of Cancer, 148 (5). pp. 1077-1086. ISSN 0020-7136

<https://doi.org/10.1002/ijc.33292>

This is the peer reviewed version of the following article: Zhou, W., Liu, G., Hung, R.J., Haycock, P.C., Aldrich, M.C., Andrew, A.S., Arnold, S.M., Bickeböller, H., Bojesen, S.E., Brennan, P., Brunnström, H., Melander, O., Caporaso, N.E., Landi, M.T., Chen, C., Goodman, G.E., Christiani, D.C., Cox, A., Field, J.K., Johansson, M., Kiemeney, L.A., Lam, S., Lazarus, P., Le Marchand, L., Rennert, G., Risch, A., Schabath, M.B., Shete, S.S., Tardón, A., Zienolddiny, S., Shen, H. and Amos, C.I. (2020), Causal Relationships between Body Mass Index, Smoking, and Lung Cancer: Univariable and Multivariable Mendelian Randomization. Int. J. Cancer., which has been published in final form at <https://doi.org/10.1002/ijc.33292>. This article may be used for non-commercial purposes in accordance with Wiley Terms and Conditions for Use of Self-Archived Versions.

Causal Relationships between Body Mass Index, Smoking, and Lung Cancer: Univariable and Multivariable Mendelian Randomization

Wen Zhou, Geoffrey Liu, Rayjean J. Hung, Philip C. Haycock, Melinda C. Aldrich, Angeline S. Andrew, Susanne M. Arnold, Heike Bickeböller, Stig E. Bojesen, Paul Brennan, Hans Brunnström, Olle Melander, Neil E. Caporaso, Maria Teresa Landi, Chu Chen, Gary E. Goodman, David C. Christiani, Angela Cox, John K. Field, Mikael Johansson, Lambertus A. Kiemeneij, Stephen Lam, Philip Lazarus, Loïc Le Marchand, Gad Rennert, Angela Risch, Matthew B. Schabath, Sanjay S. Shete, Adonina Tardón, Shanbeh Zienoldiny, Hongbing Shen, Christopher I. Amos

Contents

[Supplementary Table S1](#)

Detailed information for instrumental variables of BMI, smoking status, age of smoking initiation, smoking cessation, and cigarettes per day

[Supplementary Table S2](#)

F-statistic and R^2 for instrumental variables of BMI, smoking status, age of smoking initiation, smoking cessation, and cigarettes per day

[Supplementary Table S3](#)

Causal relationships of BMI on lung cancer and histological subtypes estimated by approach of MR-Weighted median, MR-Weighted mode, and MR-Egger

[Supplementary Table S4](#)

Causal relationships of smoking behaviors on lung cancer and histological subtypes estimated by univariable MR

[Supplementary Table S5](#)

Causal relationships between BMI and Smoking phenotypes estimated by bidirectional MR

[Supplementary Table S6](#)

Causal relationships of BMI on smoking phenotype adjusted for other smoking phenotypes estimated by multivariable MR

[Supplementary Table S7](#)

Causal relationships of smoking phenotype on BMI and adjusted for collider effect of lung cancer estimated by multivariable MR

[Supplementary Table S8](#)

Causal relationships of BMI on lung cancer and histological subtypes estimated by univariable MR using different genome-wide significance threshold

[Supplementary Table S9](#)

Causal relationships of smoking behaviors on lung cancer and histological subtypes estimated by univariable MR using different genome-wide significance threshold

[Supplementary Table S10](#)

Causal relationships of BMI and smoking phenotypes on lung cancer and histological subtypes estimated by multivariable MR using different genome-wide significance threshold

[Supplementary Table S11](#)

Cochran's Q test for heterogeneity among MR analyses

[Supplementary Table S12](#)

Causal relationship of SmkCes on lung cancer and histological subtypes with and without outliers rs518425 and rs56113850

[Supplementary Table S13](#)

Causal relationships of BMI on lung cancer among ever-/never-smokers estimated by univariable MR

[Supplementary Table S14](#)

Causal relationships of BMI and smoking phenotypes on lung cancer among ever-/never-smokers estimated by multivariable MR

[Supplementary Figure S1](#)

Statistical power estimation based on the sample size of lung cancer GWAS (29,266 cases and 56,450 controls), with an alpha level of 0.05 and the proportion of variance explained by genetic instruments for corresponding exposures.

[Supplementary Figure S2](#)

Odds ratios and 95% confidence intervals for the effect of BMI on lung cancer and histological subtypes estimated by univariable MR using BMI-All SNPs, BMI&Smoking SNPs, and BMI-Only.

[Supplementary Figure S3](#)

Odds ratios and 95% confidence intervals for the effect of smoking behaviors on lung cancer and histological subtypes estimated by univariable MR.

[Supplementary Figure S4](#)

Odds ratios and 95% confidence intervals for the effect of BMI on smoking phenotypes estimated by univariable MR using BMI-All SNPs, BMI&Smoking SNPs, and BMI-Only.

[Supplementary Figure S5](#)

Odds ratios and 95% confidence intervals for the effect of smoking behaviors on BMI estimated by univariable MR.

[Supplementary Figure S6](#)

Funnel plots to show symmetrical distribution of individual variant estimates around the point estimate.

[Supplementary Figure S7](#)

Funnel plots to show symmetrical distribution of individual variant estimates around the point estimate.

[Supplementary Figure S8](#)

Scatter plots for effect sizes of SNPs for BMI and those for lung cancer and histological subtypes.

[Supplementary Figure S9](#)

Scatter plots for effect sizes of SNPs for smoking behaviors and those for lung cancer and histological subtypes.

[Supplementary Figure S10](#)

Scatter plots for effect sizes of SNPs for smoking cessation and those for lung cancer and histological subtypes with and without outliers.

[Supplementary Figure S11](#)

Causal relationships of BMI and smoking phenotypes on lung cancer estimated by multivariable MR Egger.

Table S1. Detailed information for instrumental variables of BMI, smoking status, age of smoking initiation, smoking cessation, and cigarettes per day*

*Summary statistics of SNPs were retrieved from the largest availabel meta-analysis of genome wide association studies (GWASs) for BMI^[1] and tobacco use^[2]. Chr, chromosome; EAF, allele frequency of effect allele; SE, standard error of beta; SampleSize, available sample size for each variant in according studies; SmkInit, smoking status, Ever/Never; AgeSmk, age of smoking initiation; SmkCes, smoking cessation, Current/Former; CigDay, cigarettes per day; SNP Type, only for genetic variants of BMI, SNP was defined as "BMI&Smoking SNP" if associated with both BMI and any one of the four smoking phenotypes, otherwise defined as "BMI-Only SNP". R², variance in exposure explained by each variant, calculated as: R²=2*Beta^2*EAF*(1-EAF)/(2*Beta^2*EAF*(1-EAF)+2*SE^2*SampleSize*EAF*(1-EAF))^[3]; F-statistic calculated as: F-statistic=R²*(SampleSize-2)/(1-R²)^[4].

Table S2. F-statistic and R² for instrumental variables of BMI, smoking status, age of smoking initiation, smoking cessation, and cigarettes per day

Exposure	F _{min}	F _{max}	F _{mean}	F _{median}	F _{sum} (N.SNPs)	R ² _{sum}	F _{TS}
BMI	31	1360	64	47	53523 (842)	7.33%	8.41
SmkInit	30	145	41	35	4492 (110)	0.71%	2.60
AgeSmk	31	53	39	33	274 (7)	0.10%	1.30
SmkCes	30	113	53	38	531 (10)	0.17%	1.55
CigDay	30	953	92	40	2656 (29)	1.03%	1.74

F-statistic: a statistic used to evaluate the strength of instruments; R²: the proportion of phenotypic variance explained by all genetic instruments; F_{min}: The minimum value of F-statistics of instrumental variables (IVs) for each exposure; F_{max}: The maximum value of F-statistics of IVs for each exposure; F_{mean}: Mean value of F-statistics of IVs for each exposure; F_{median}: Median F-statistics of IVs for each exposure; F_{sum}: Sum of F-statistics of IVs for each exposure; N.SNPs: Number of SNPs for each exposure; R²_{sum}: Sum of R² of IVs for each exposure; F_{TS}: a modified F-statistic which was used to evaluate the strength of instruments to predict one exposure conditional on the other exposures using two sample summary data; BMI: body mass index; SmkInit, smoking status, Ever/Never; AgeSmk, age of smoking initiation; SmkCes, smoking cessation, Current/Former; CigDay, cigarettes per day.

Table S3. Causal relationships of BMI on lung cancer and histological subtypes estimated by approach of MR-Weighted median, MR-Weighted mode, and MR-Egger

Outcome	N.SNPs	MR-Weighted median		MR-Weighted mode		MR-Egger		
		OR (95% CI)	P	OR (95% CI)	P	OR (95% CI)	P	P_{inter}^*

*The threshold used in this study. MVMR-IVW: multivariable Mendelian randomization using inverse variance weighted approach; MVMR-Egger: multivariable Mendelian randomization using Egger regression; BMI: body mass index; SmkInit: smoking status, Ever/Never; AgeSmk: age of smoking initiation; SmkCes: smoking cessation, Current/Former; CigDay: cigarettes per day.

*The Q statistic has a chi-squared distribution on N-1 degrees of freedom (df) under the null hypothesis that all genetic variants are valid IVs and the same causal effect is identified by all variants. N is the number of genetic variants.^[1] Overall: overall lung cancer; Adeno: lung adenocarcinoma; Squam: lung squamous cell carcinoma; Small: small cell lung cancer; SmkInit, smoking status, Ever/Never; AgeSmk, age of smoking initiation; SmkCes, smoking cessation, Current/Former; CigDay, cigarettes per day; BMI-All SNPs: All genetic instruments associated with BMI; BMI&Smoking SNPs: the genetic instruments associated with both BMI and any one of the four smoking phenotypes; BMI-Only SNPs: the genetic instruments only associated with BMI.

SmkCes	3	1.18 (0.81-1.71)	0.383	1.18 (0.81-1.71)	0.384	
CigDay	8	0.84 (0.60-1.16)	0.277	0.84 (0.60-1.16)	0.277	

MVMR-IVW: multivariable Mendelian randomization using inverse variance weighted approach; MVMR-Egger: multivariable Mendelian randomization using Egger regression; SmkInit, smoking status, Ever/Never; AgeSmk, age of smoking initiation; SmkCes, smoking cessation, Current/Former; CigDay, cigarettes per day; N.SNPs: number of SNPs used in MR; * P value for intercept test of multivariable MR Egger.

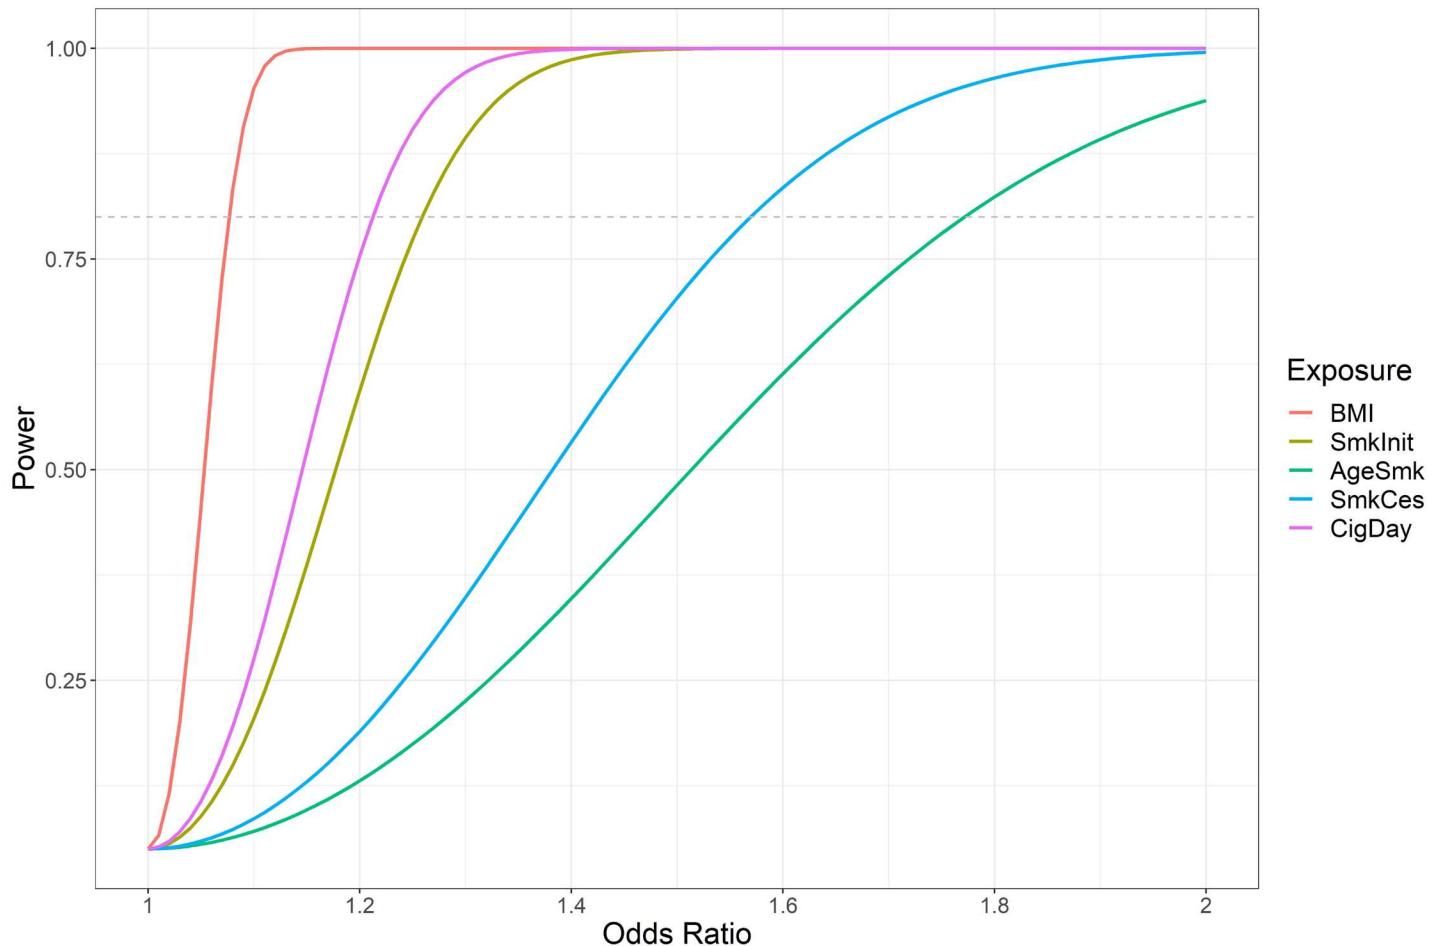

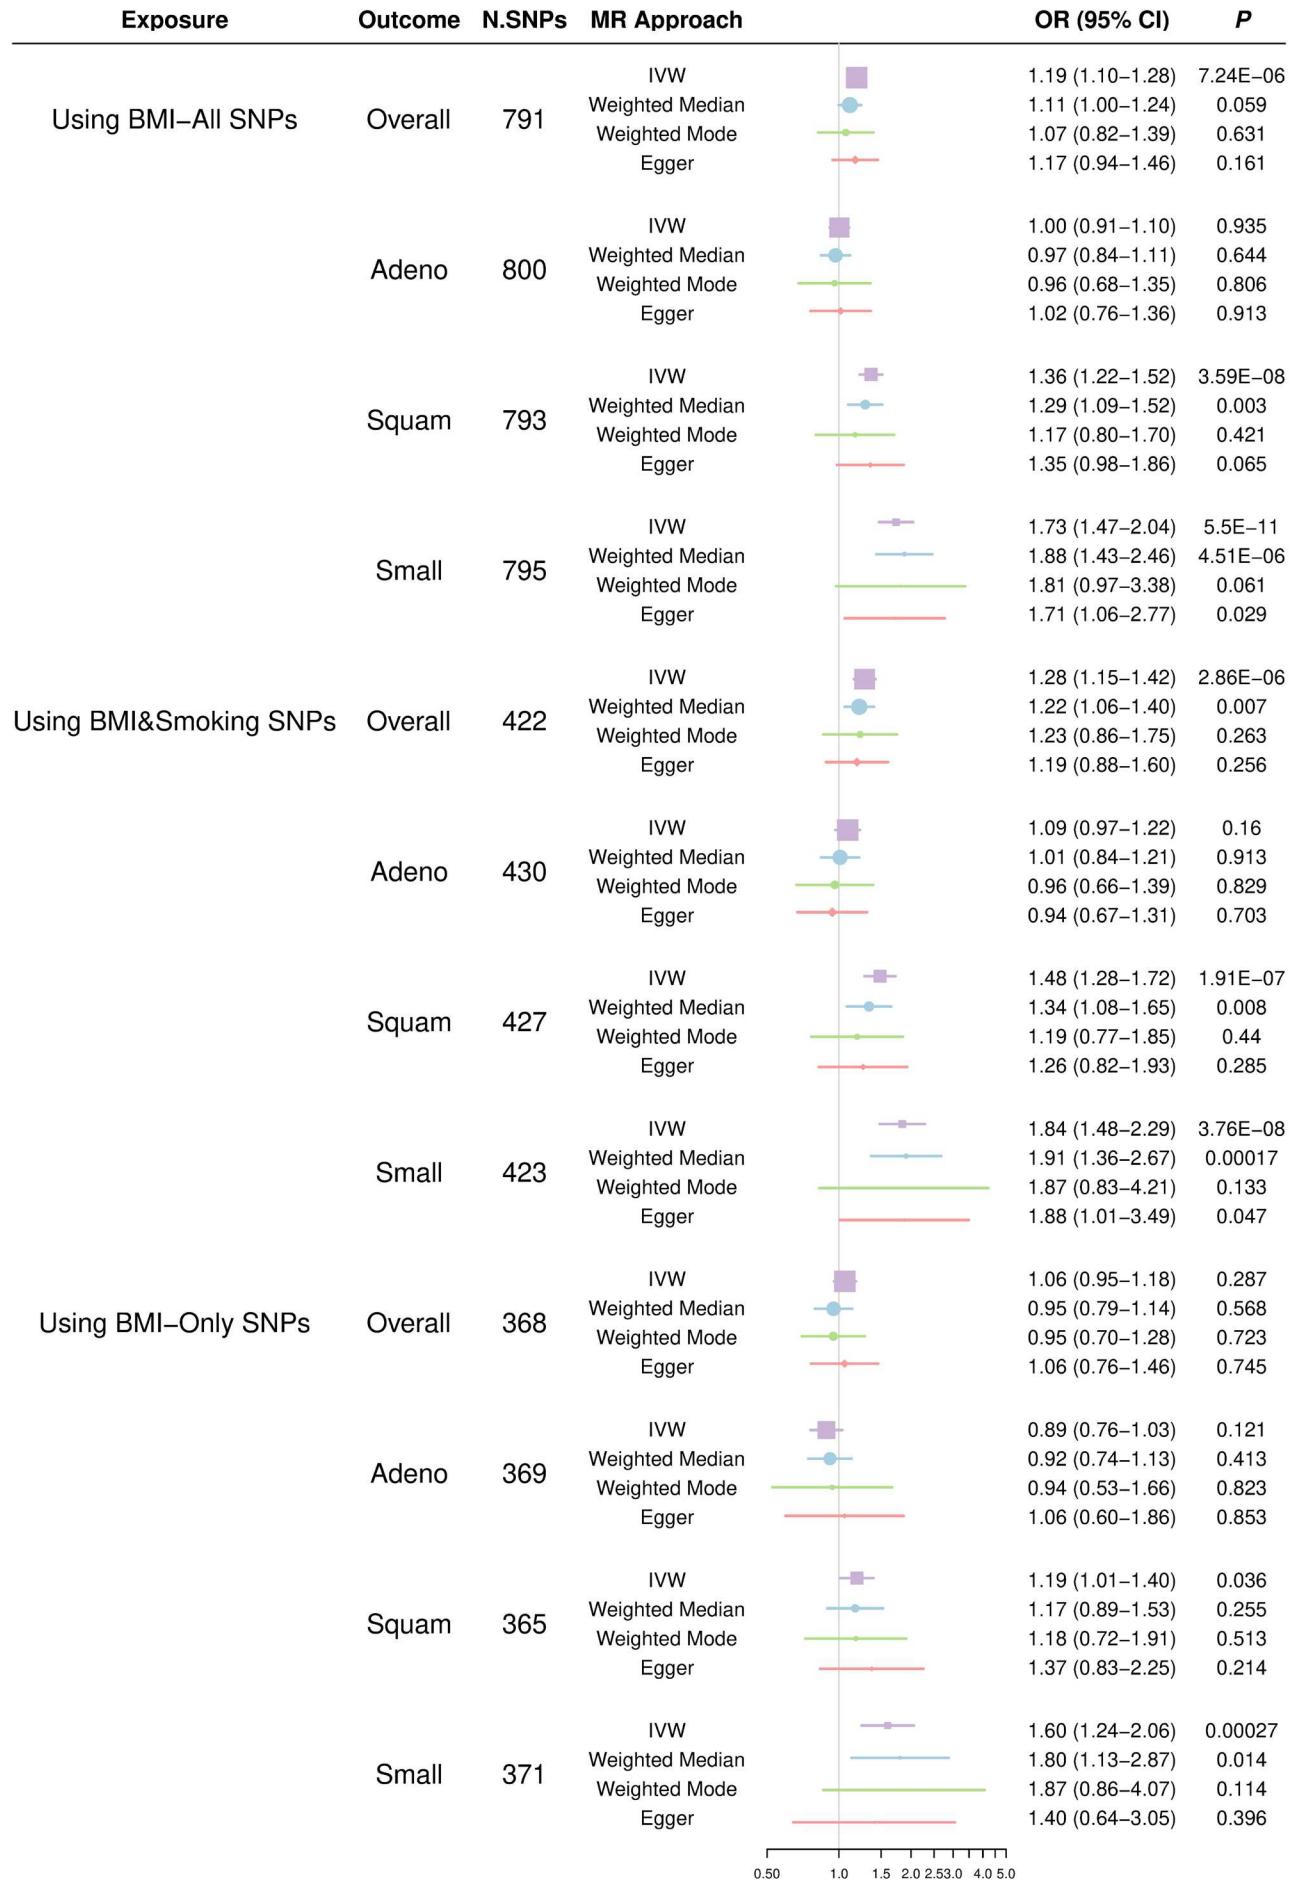

Figure S1. Statistical power estimation based on the sample size of lung cancer GWAS (29,266 cases and 56,450 controls), with an alpha level of 0.05 and the proportion of variance explained by genetic instruments for corresponding exposures. BMI: body mass index; SmkInit: smoking status, Ever/Never; AgeSmk: age of smoking initiation; SmkCes: smoking cessation, Current/Former; CigDay: cigarettes per day. The grey dotted line indicates 80% statistical power.

■ MR–IVW ■ MR–Weighted Median ■ MR–Weighted Mode ■ MR–Egger

Figure S2. Odds ratios and 95% confidence intervals for the effect of BMI on lung cancer and histological subtypes estimated by univariable MR using BMI-All SNPs, BMI&Smoking SNPs, and BMI-Only. BMI-All SNPs: All genetic instruments associated with BMI; BMI&Smoking SNPs: the genetic instruments associated with both BMI and any one of the four smoking phenotypes; BMI-Only SNPs: the genetic instruments only associated with BMI; Overall: overall lung cancer; Adeno: lung adenocarcinoma; Squam: lung squamous cell carcinoma; Small: small cell lung cancer; N.SNPs: number of SNPs used in MR, similarly hereinafter. Colors indicate for four approaches used in MR analyses.

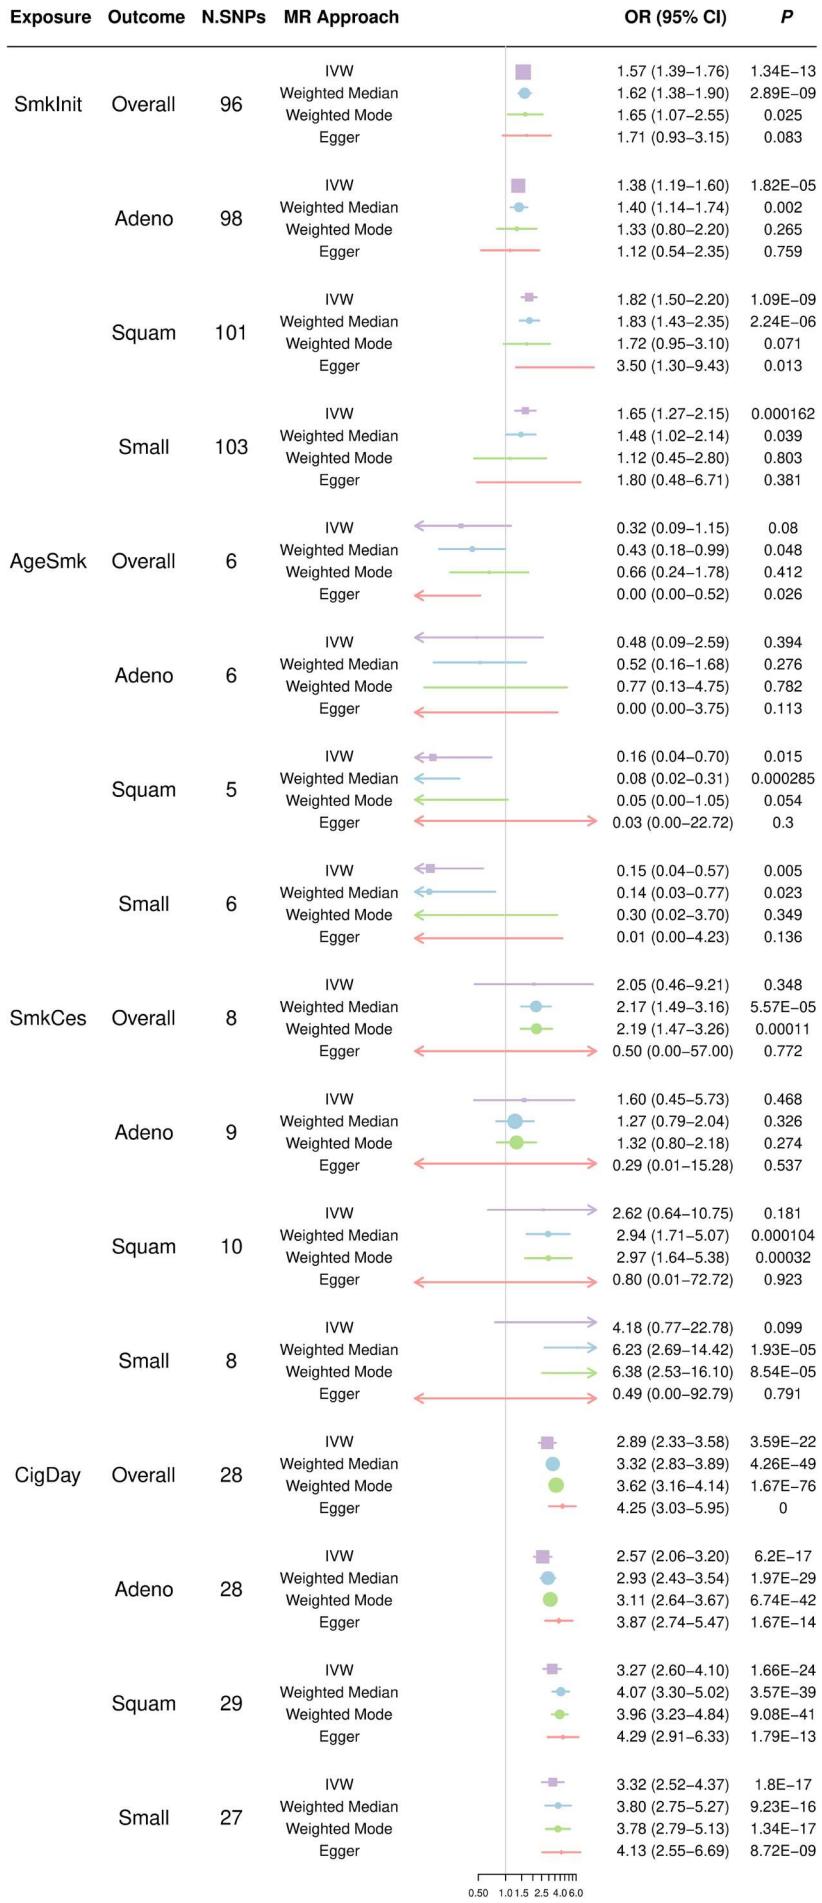

Figure S3. Odds ratios and 95% confidence intervals for the effect of smoking behaviors on lung cancer and histological subtypes estimated by univariable MR. SmkInit, smoking status, Ever/Never; AgeSmk, age of smoking initiation; SmkCes, smoking cessation, Current/Former; CigDay, cigarettes per day; Overall: overall lung cancer; Adeno: lung adenocarcinoma; Squam: lung squamous cell carcinoma; Small: small cell lung cancer; N.SNPs: number of SNPs used in MR, similarly hereinafter. Colors indicate for four approaches used in MR analyses.

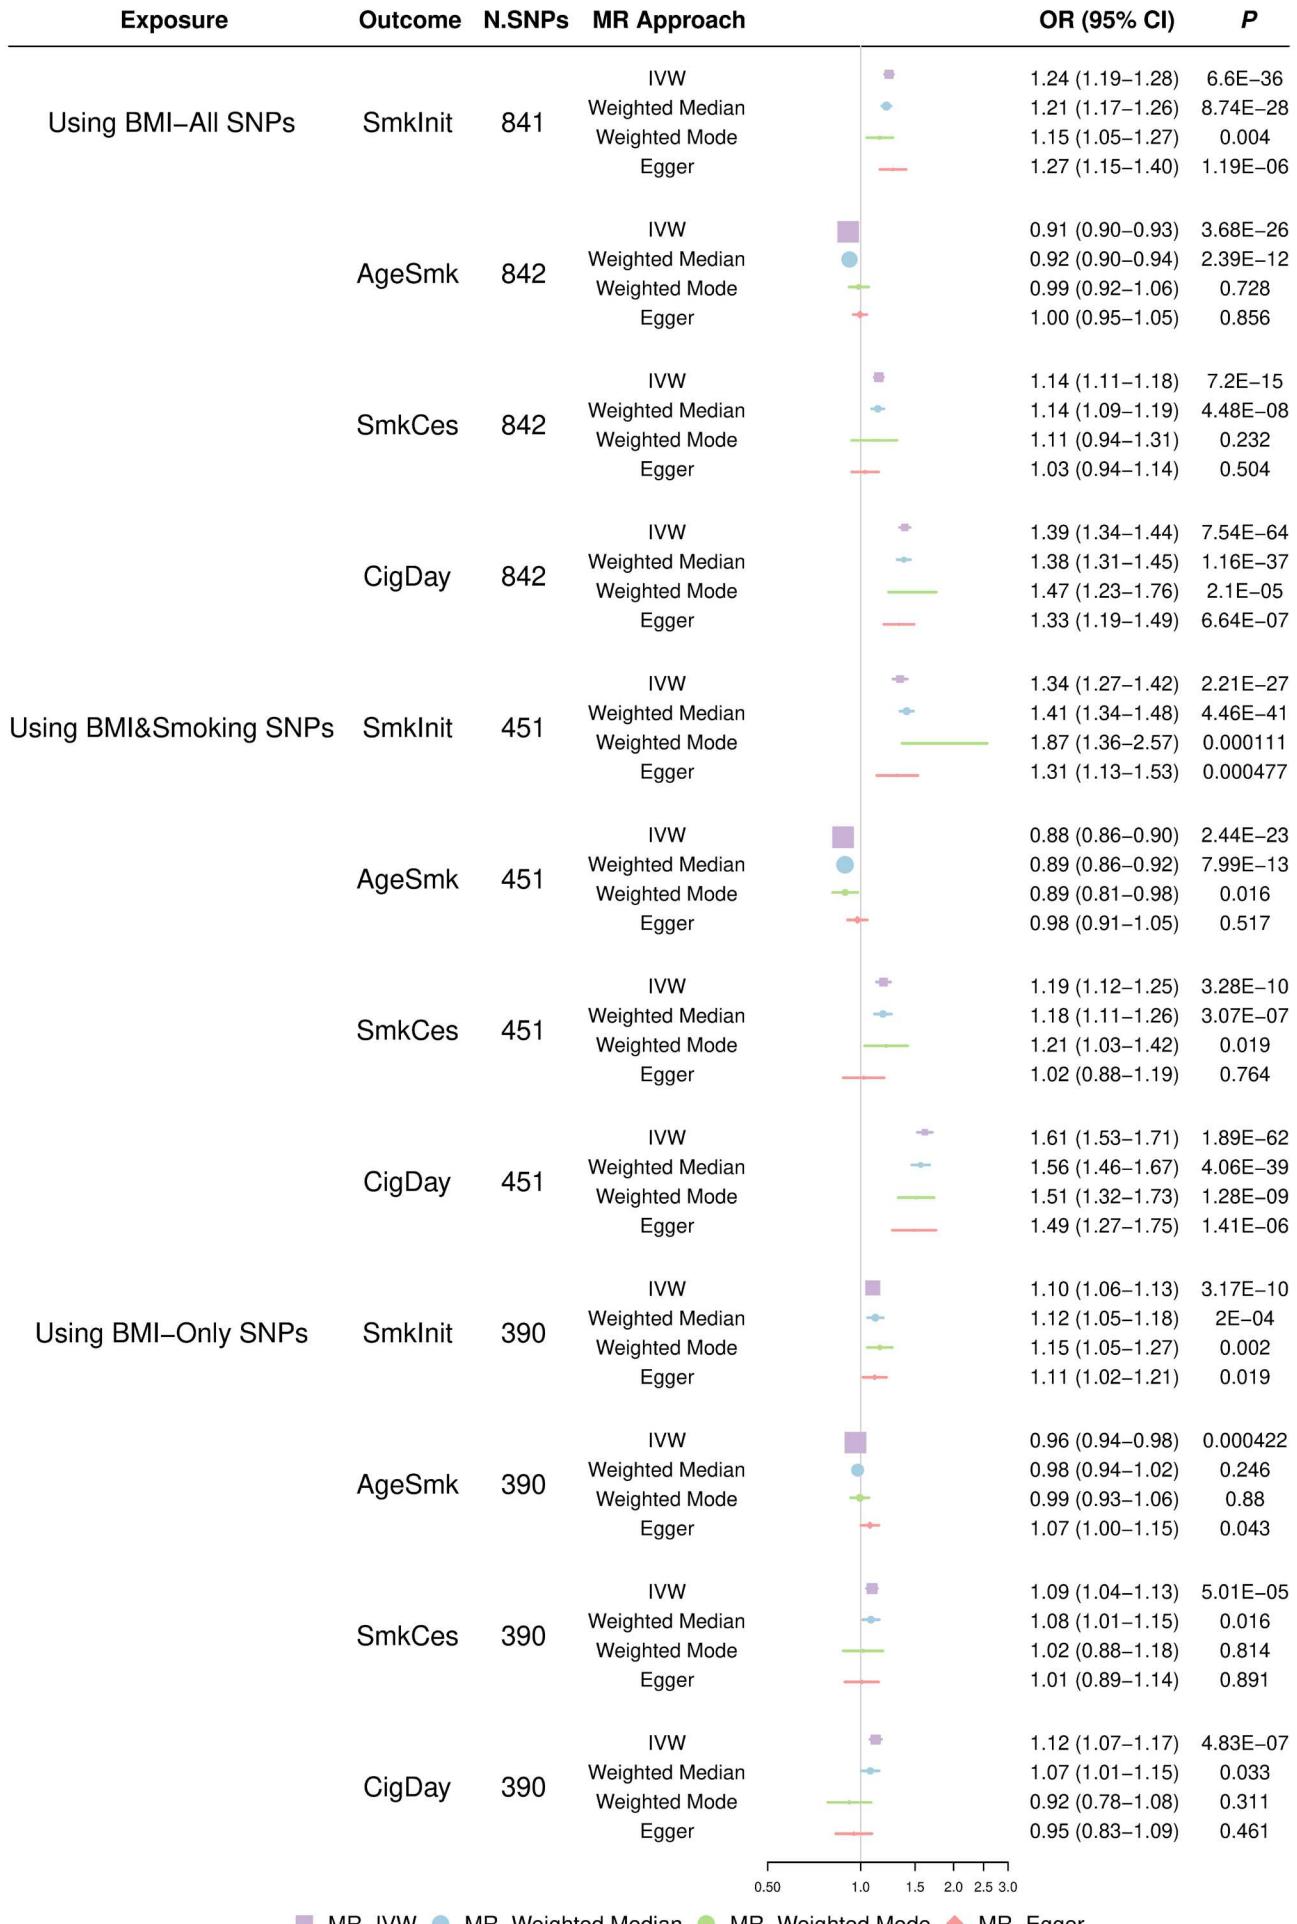

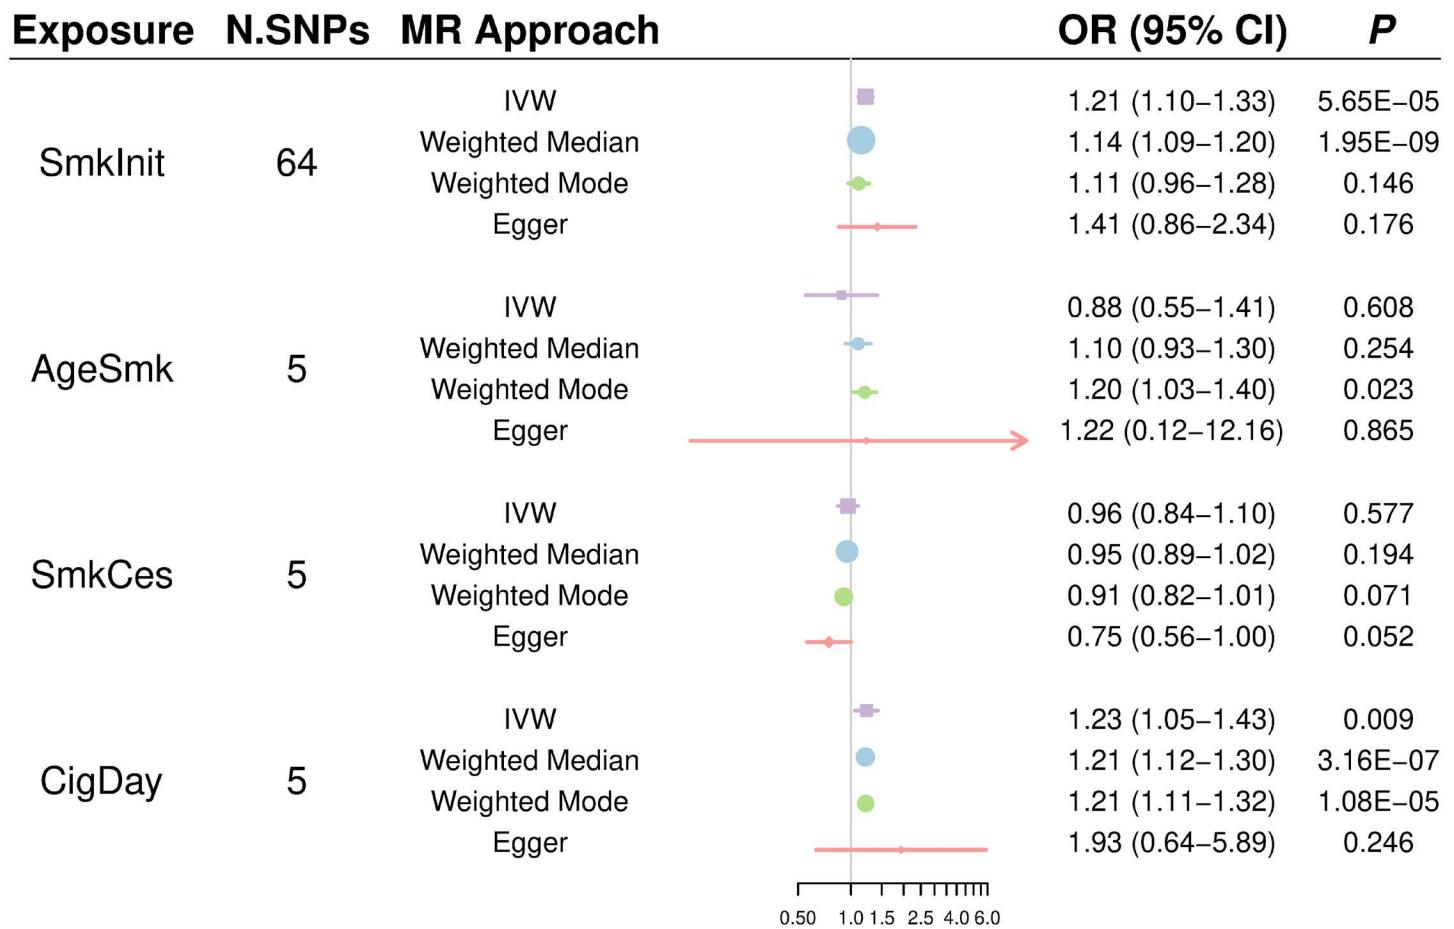

Figure S4. Odds ratios and 95% confidence intervals for the effect of BMI on smoking phenotypes estimated by univariable MR using BMI-All SNPs, BMI&Smoking SNPs, and BMI-Only. BMI-All SNPs: All genetic instruments associated with BMI; BMI&Smoking SNPs: the genetic instruments associated with both BMI and any one of the four smoking phenotypes; BMI-Only SNPs: the genetic instruments only associated with BMI; SmkInit, smoking status, Ever/Never; AgeSmk, age of smoking initiation; SmkCes, smoking cessation, Current/Former; CigDay, cigarettes per day; N.SNPs: number of SNPs used in MR. Colors indicate for four approaches used in MR analyses.

■ MR-IVW ■ MR-Weighted Median ■ MR-Weighted Mode ■ MR-Egger

Figure S5. Odds ratios and 95% confidence intervals for the effect of smoking behaviors on BMI estimated by univariable MR. SmkInit, smoking status, Ever/Never; AgeSmk, age of smoking initiation; SmkCes, smoking cessation, Current/Former; CigDay, cigarettes per day; N.SNPs: number of SNPs used in MR. Colors indicate for four approaches used in MR analyses.

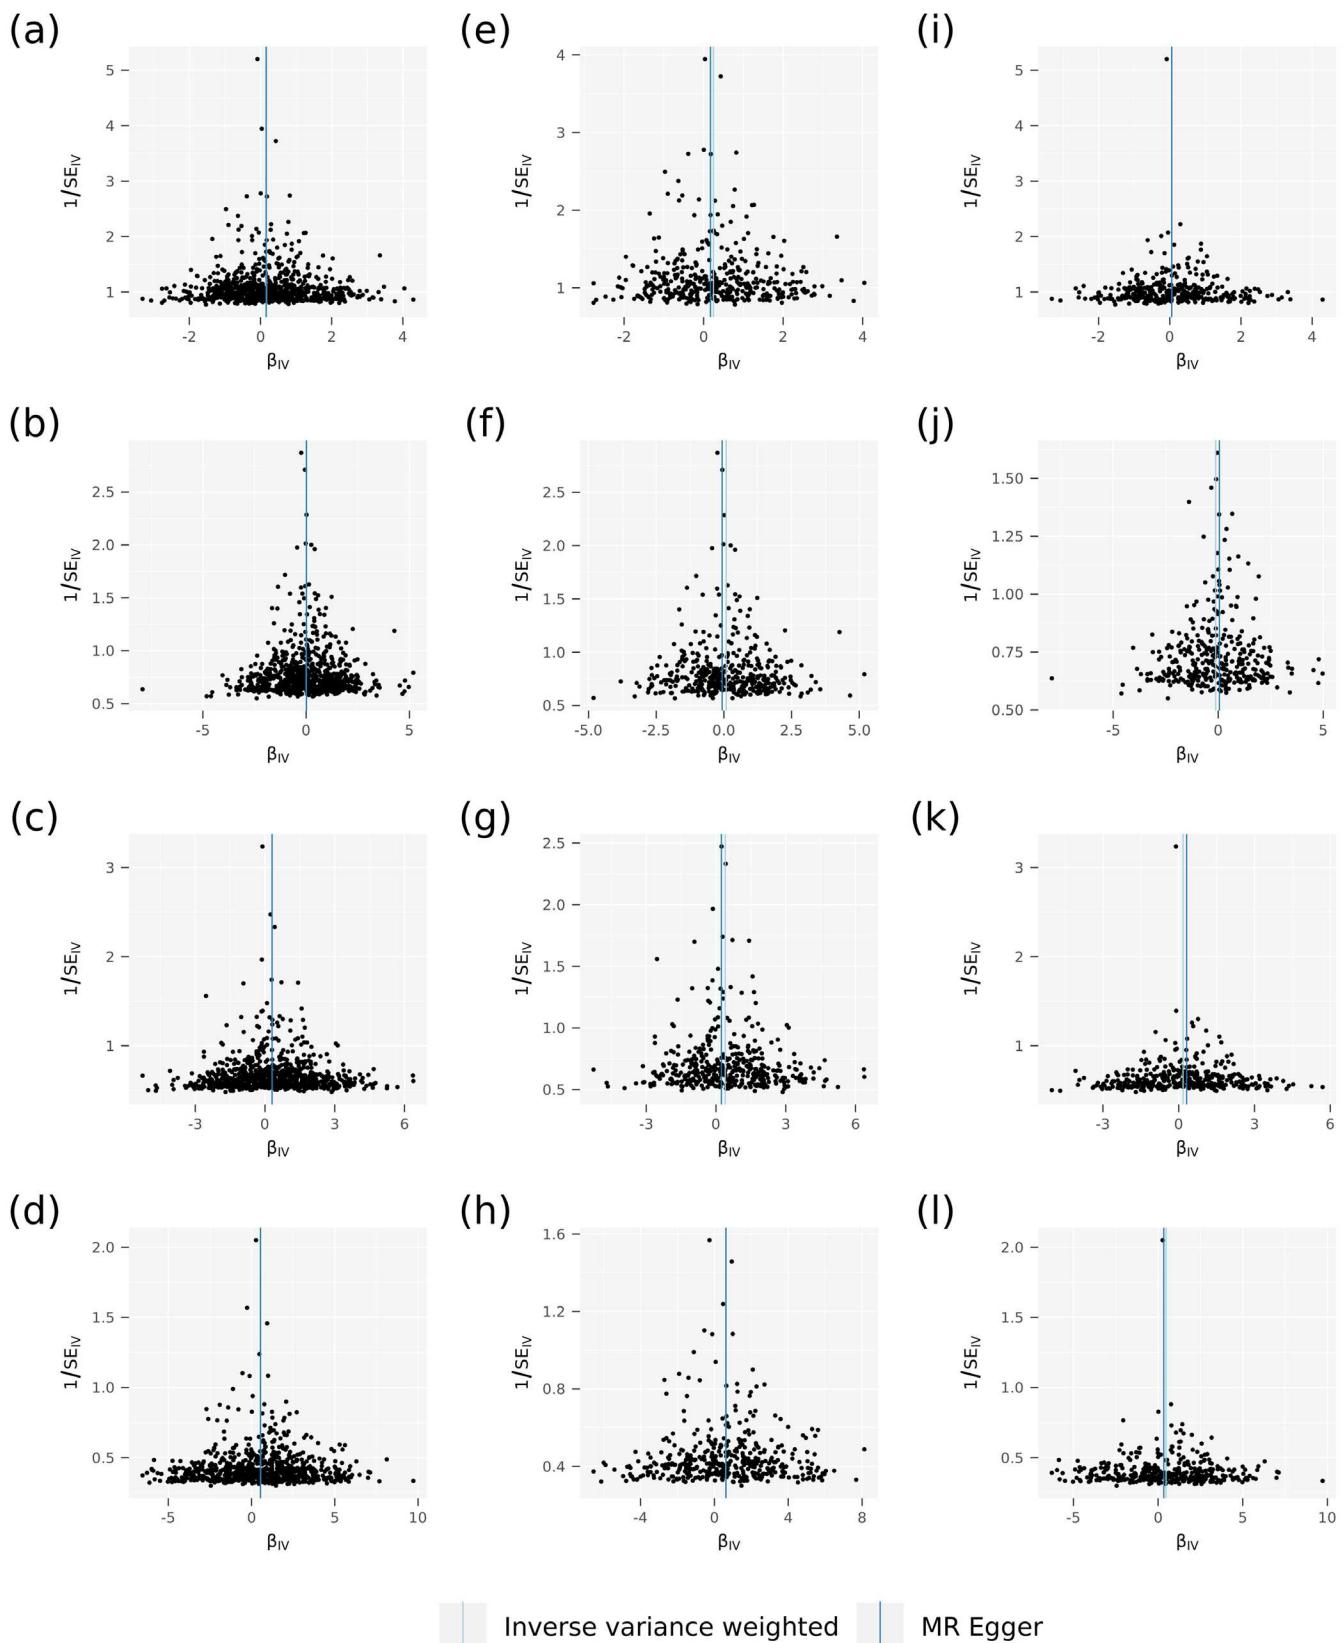

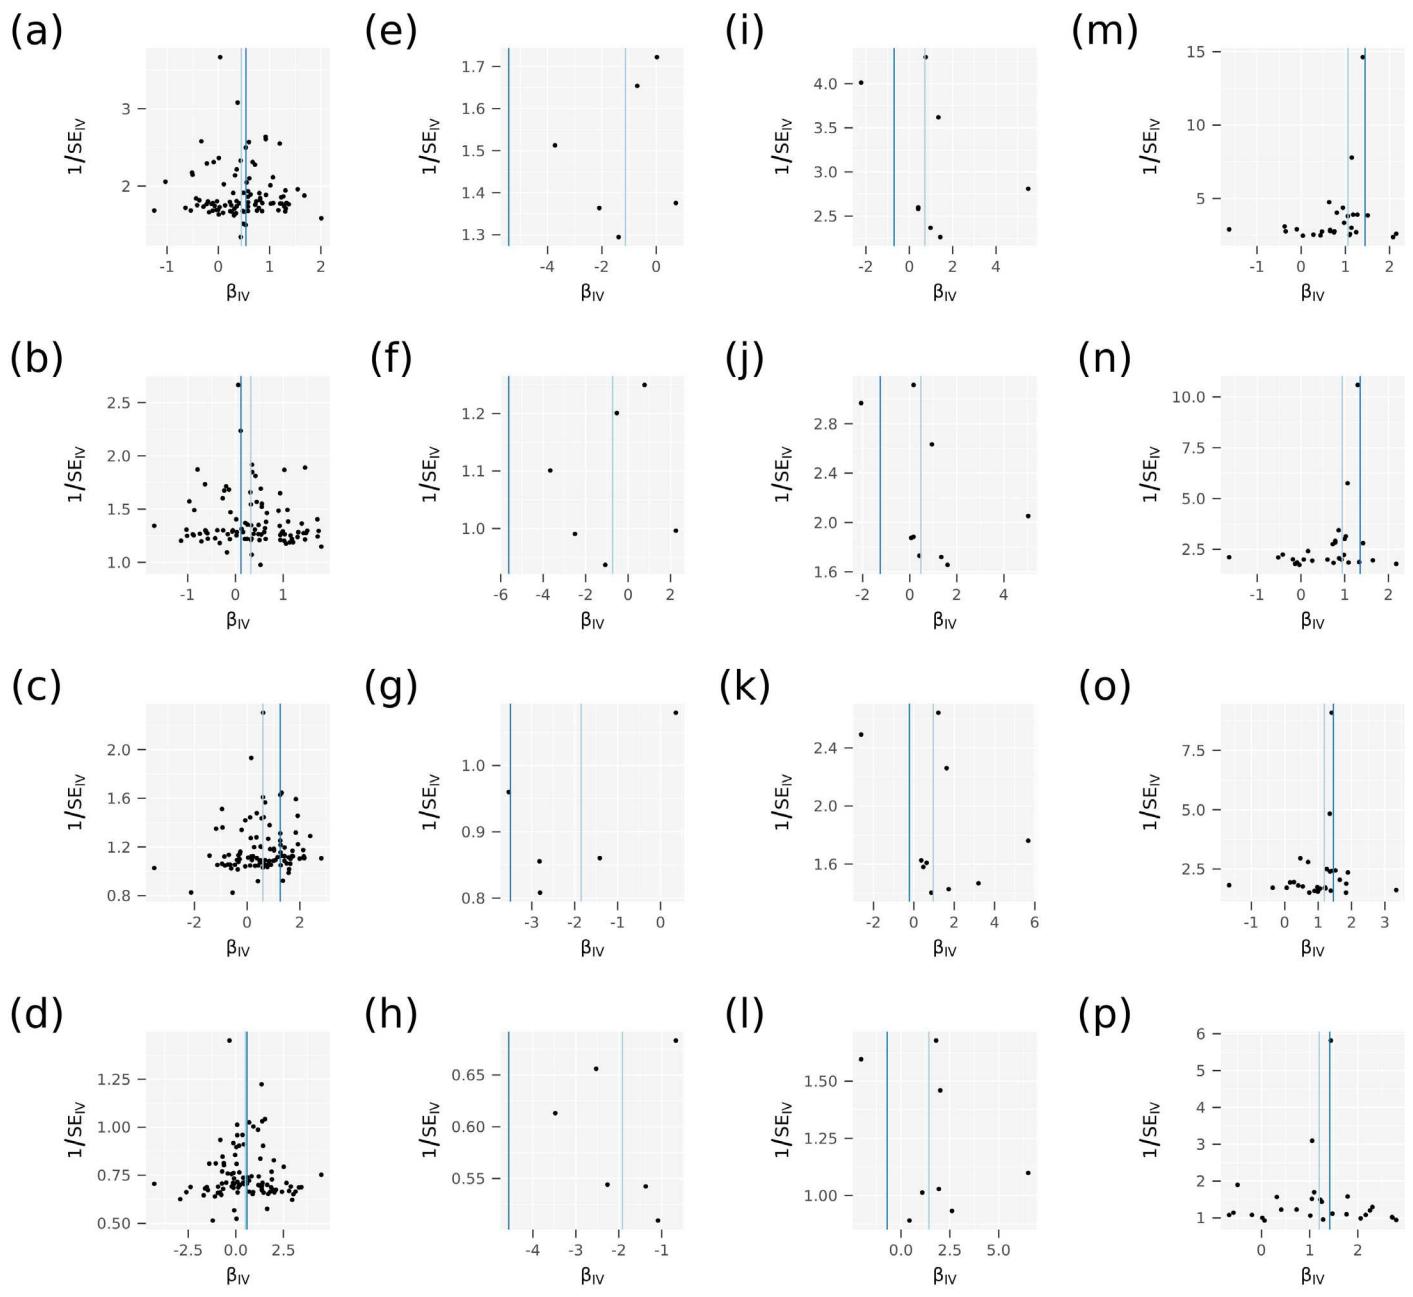

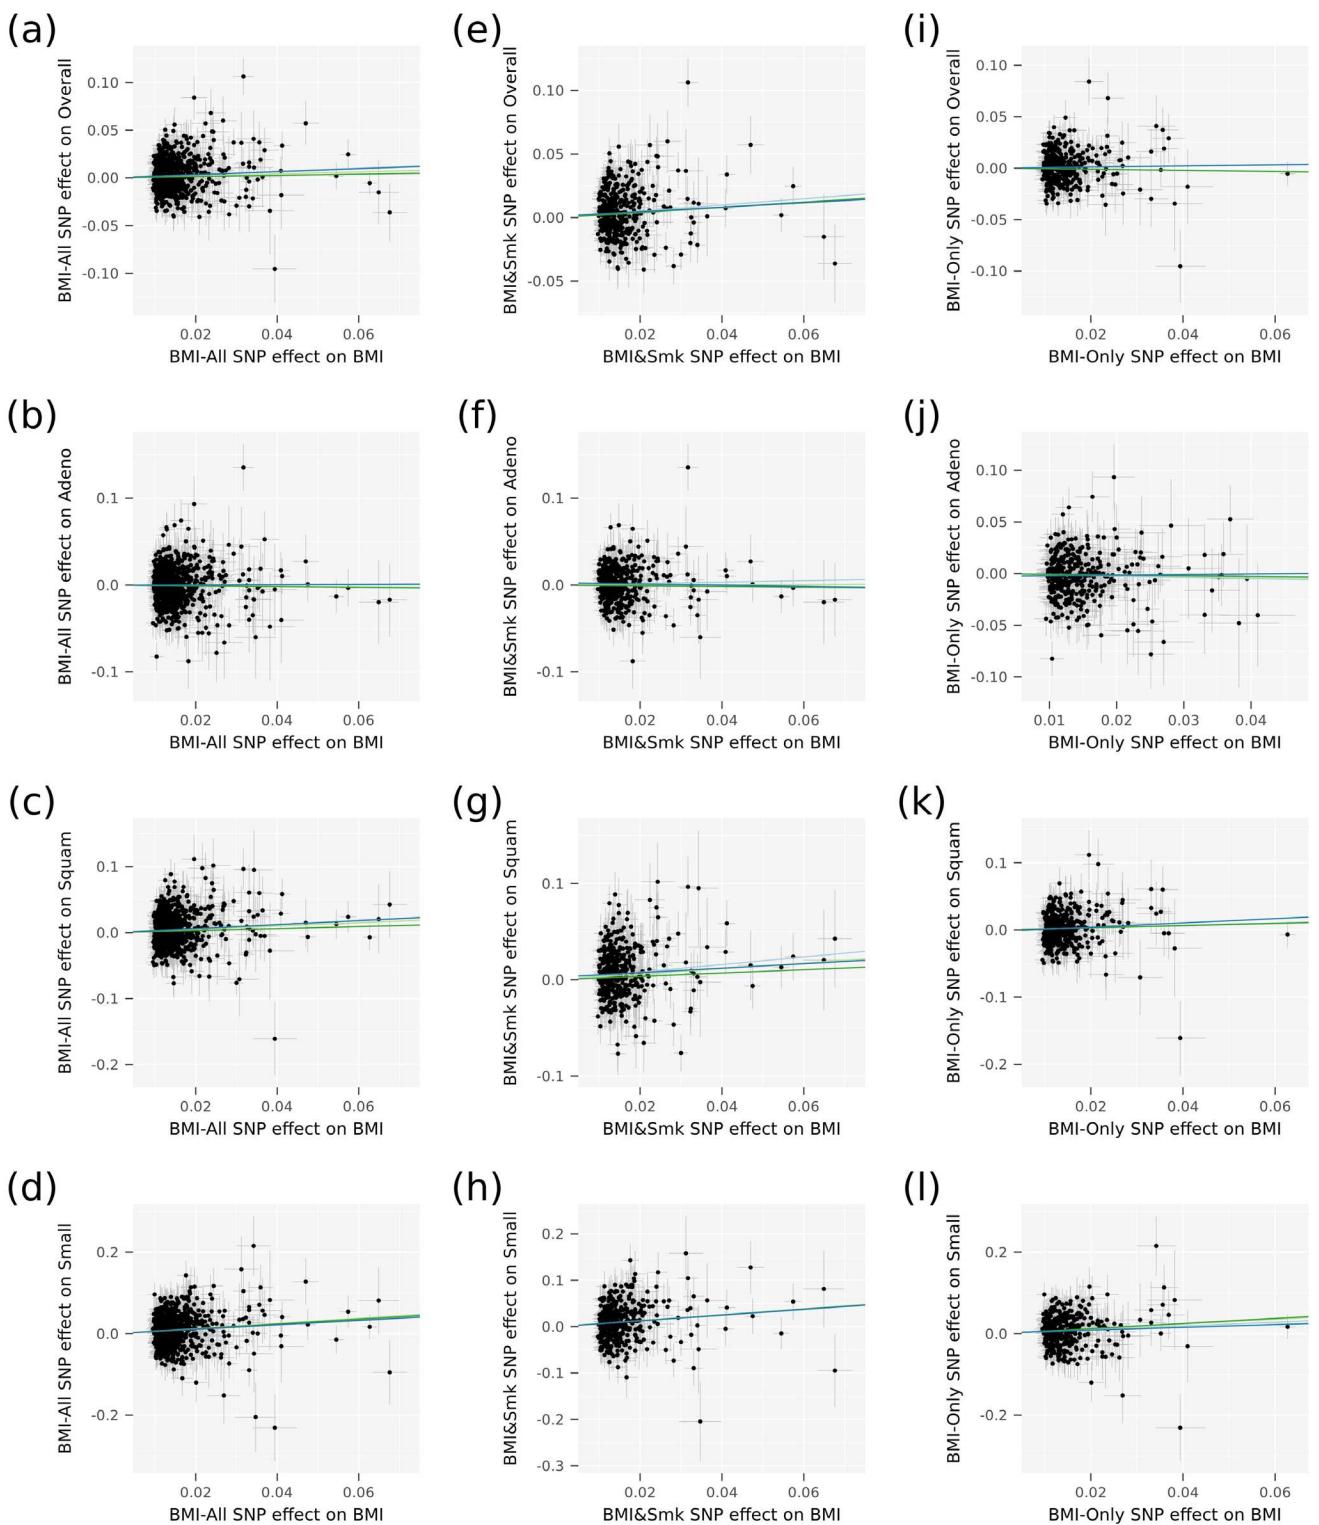

Figure S6. Funnel plots to show symmetrical distribution of individual variant estimates around the point estimate. (a-d) Funnel plots for BMI-All SNPs; (e-h) Funnel plots for BMI&Smoking SNPs; and (i-l) Funnel plots for BMI-Only SNPs. The x-axis represents the MR estimate of individual variants; the y-axis represents the inverse of their standard error. Effects were estimated for BMI on overall lung cancer, lung adenocarcinoma, lung squamous cell carcinoma, and small cell lung cancer, respectively. BMI-All SNPs: All genetic instruments associated with BMI; BMI&Smoking SNPs: the genetic instruments associated with both BMI and any one of the four smoking phenotypes; BMI-Only SNPs: the genetic instruments only associated with BMI. Colors indicate for approaches used in univariable MR analyses.

Inverse variance weighted MR Egger

Figure S7. Funnel plots to show symmetrical distribution of individual variant estimates around the point estimate. (a-d) Funnel plots for SmkInit; (e-h) Funnel plots for AgeSmk; (i-l) Funnel plots for SmkCes; and (m-p) Funnel plots for CigDay. The x-axis represents the MR estimate of individual variants; the y-axis represents the inverse of their standard error. Effects were estimated for smoking behaviors on overall lung cancer, lung adenocarcinoma, lung squamous cell carcinoma, and small cell lung cancer, respectively. SmkInit, smoking status, Ever/Never; AgeSmk, age of smoking initiation; SmkCes, smoking cessation, Current/Former; CigDay, cigarettes per day. Colors indicate for approaches used in univariable MR analyses.

Inverse variance weighted Weighted median Weighted mode MR Egger

Figure S8. Scatter plots for effect sizes of SNPs for BMI and those for lung cancer and histological subtypes. (a-d) Scatter plots for BMI-All SNPs; (e-h) Scatter plots for BMI&Smoking SNPs and (i-l) Scatter plots for BMI-Only SNPs. The x-axis represents the effect size of SNPs on BMI; the y-axis represents the effect size of SNPs on lung cancer and histological subtypes. BMI-All SNPs: All genetic instruments associated with BMI; BMI&Smoking SNPs: the genetic instruments associated with both BMI and any one of the four smoking phenotypes; BMI-Only SNPs: the genetic instruments only associated with BMI; Overall: overall lung cancer; Adeno: lung adenocarcinoma; Squam: lung squamous cell carcinoma; Small: small cell lung cancer. Colors of fitted line indicate for four approaches used in univariable MR analyses.

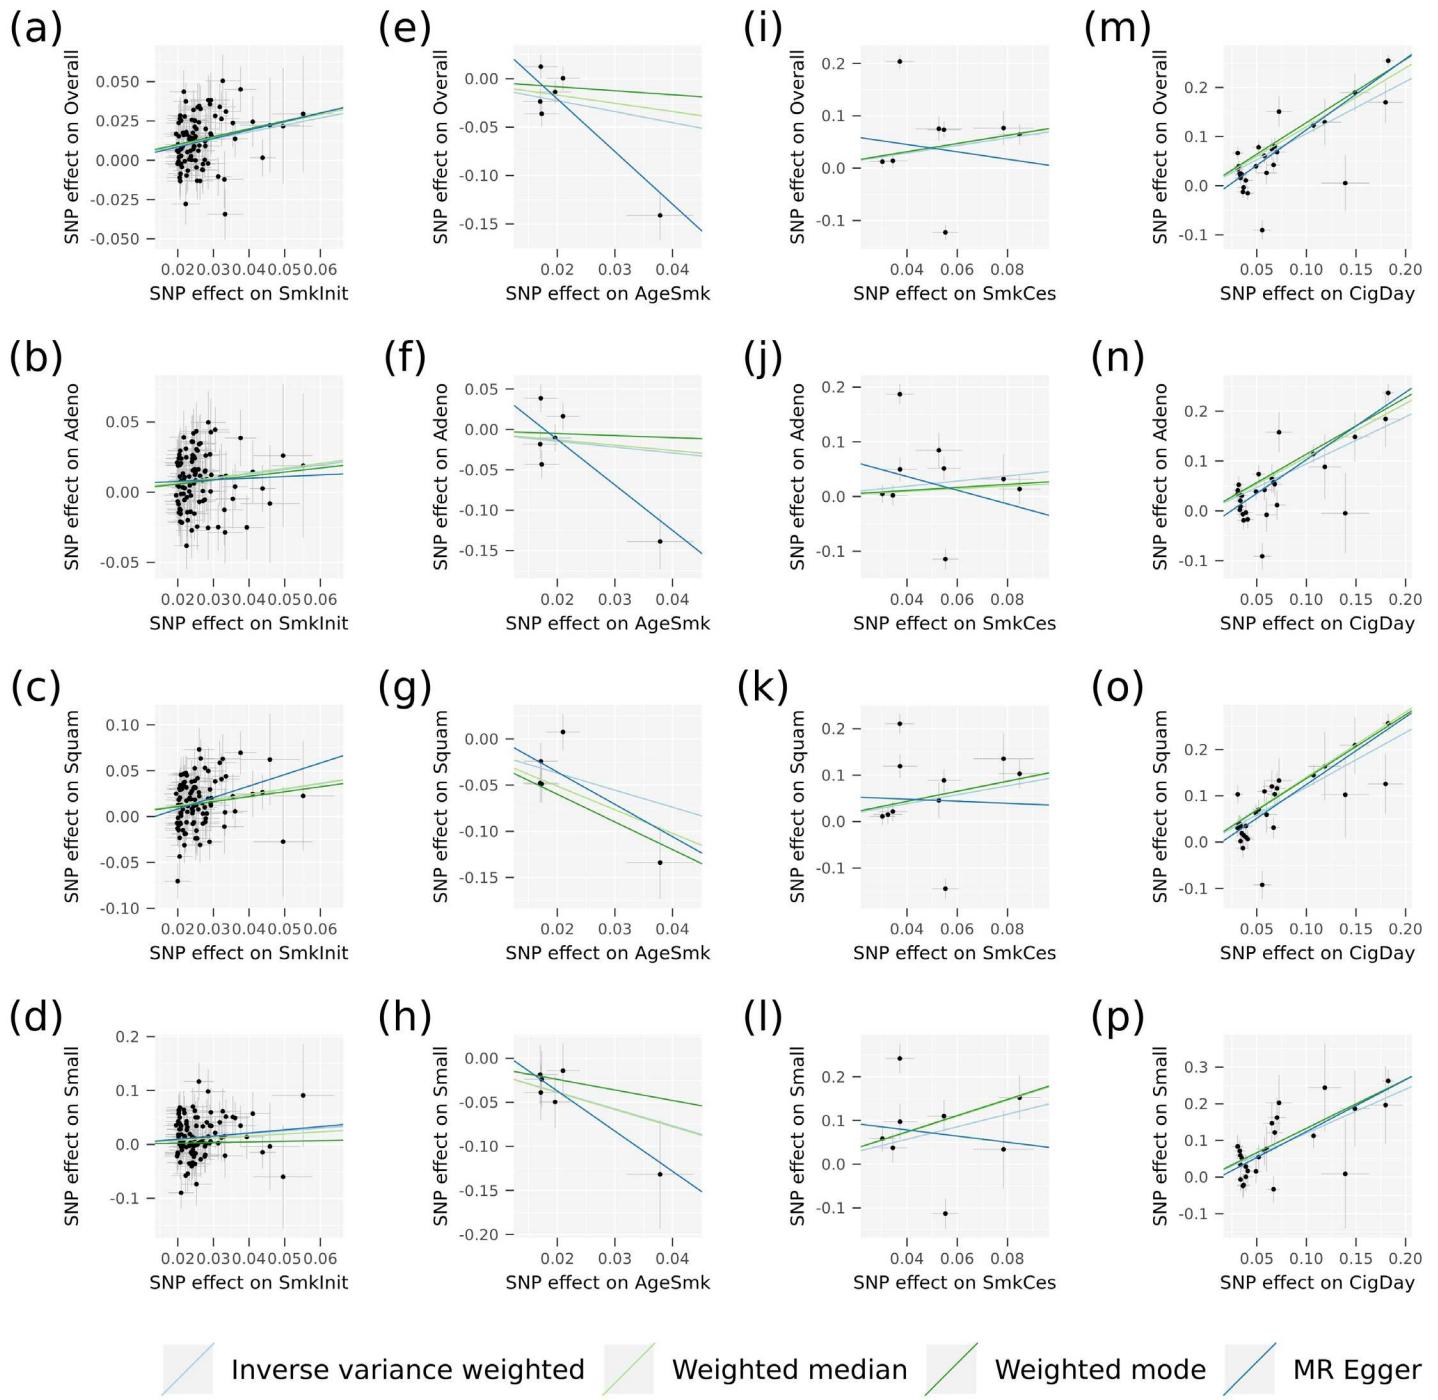

Figure S9. Scatter plots for effect sizes of SNPs for smoking behaviors and those for lung cancer and histological subtypes.

(a-d) Scatter plots for SmkInit; (e-h) Scatter plots for AgeSmk; (i-l) Scatter plots for SmkCes; and (m-p) Scatter plots for CigDay. The x-axis represents the effect size of SNPs on smoking behaviors; the y-axis represents the effect size of SNPs on lung cancer and histological subtypes. SmkInit, smoking status, Ever/Never; AgeSmk, age of smoking initiation; SmkCes, smoking cessation, Current/Former; CigDay, cigarettes per day; Overall: overall lung cancer; Adeno: lung adenocarcinoma; Squam: lung squamous cell carcinoma; Small: small cell lung cancer. Colors of fitted line indicate for four approaches used in univariable MR analyses.

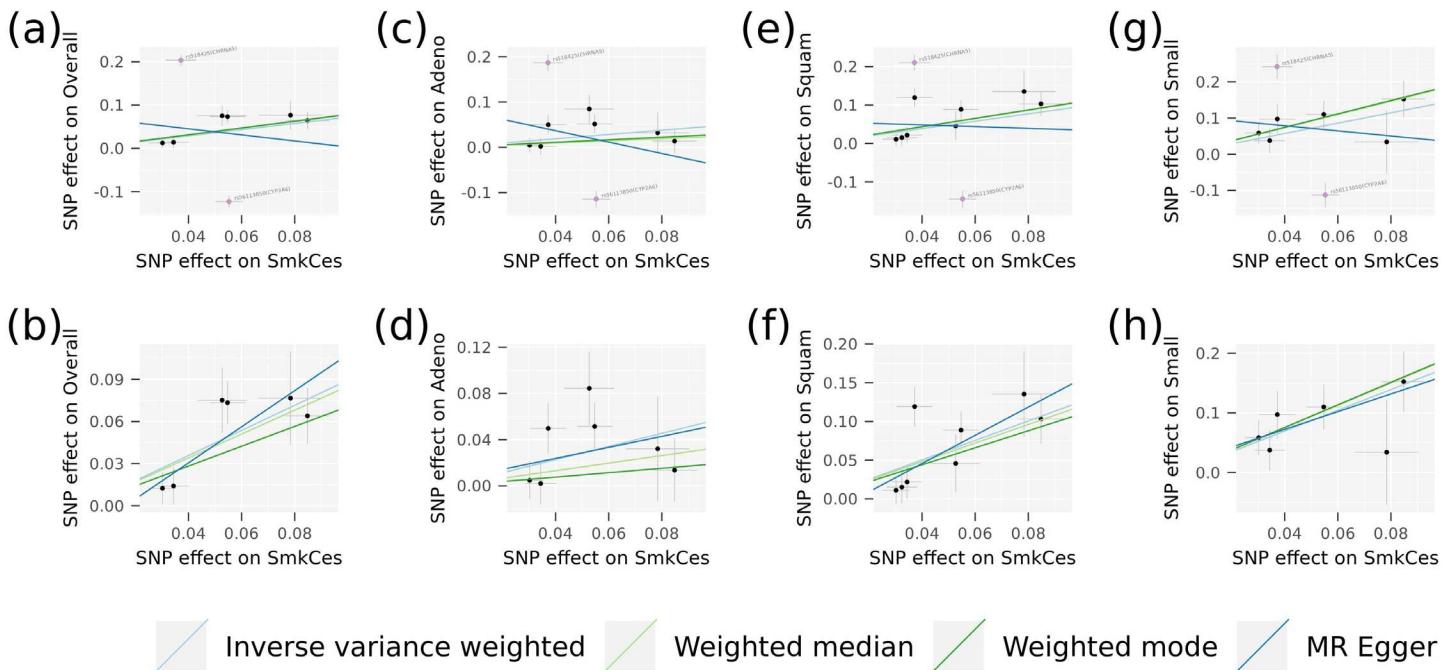

Figure S10. Scatter plots for effect sizes of SNPs for smoking cessation and those for lung cancer and histological subtypes with and without outliers.

Upper: scatter plots with outliers; Bottom: scatter plots without outliers. The x-axis represents the effect size of SNPs on smoking cessation; the y-axis represents the effect size of SNPs on overall lung cancer, lung adenocarcinoma, lung squamous cell carcinoma, and small cell lung carcinoma, respectively. Colors of fitted line indicate for four approaches used in univariable MR analyses. The outliers are marked as purple points.

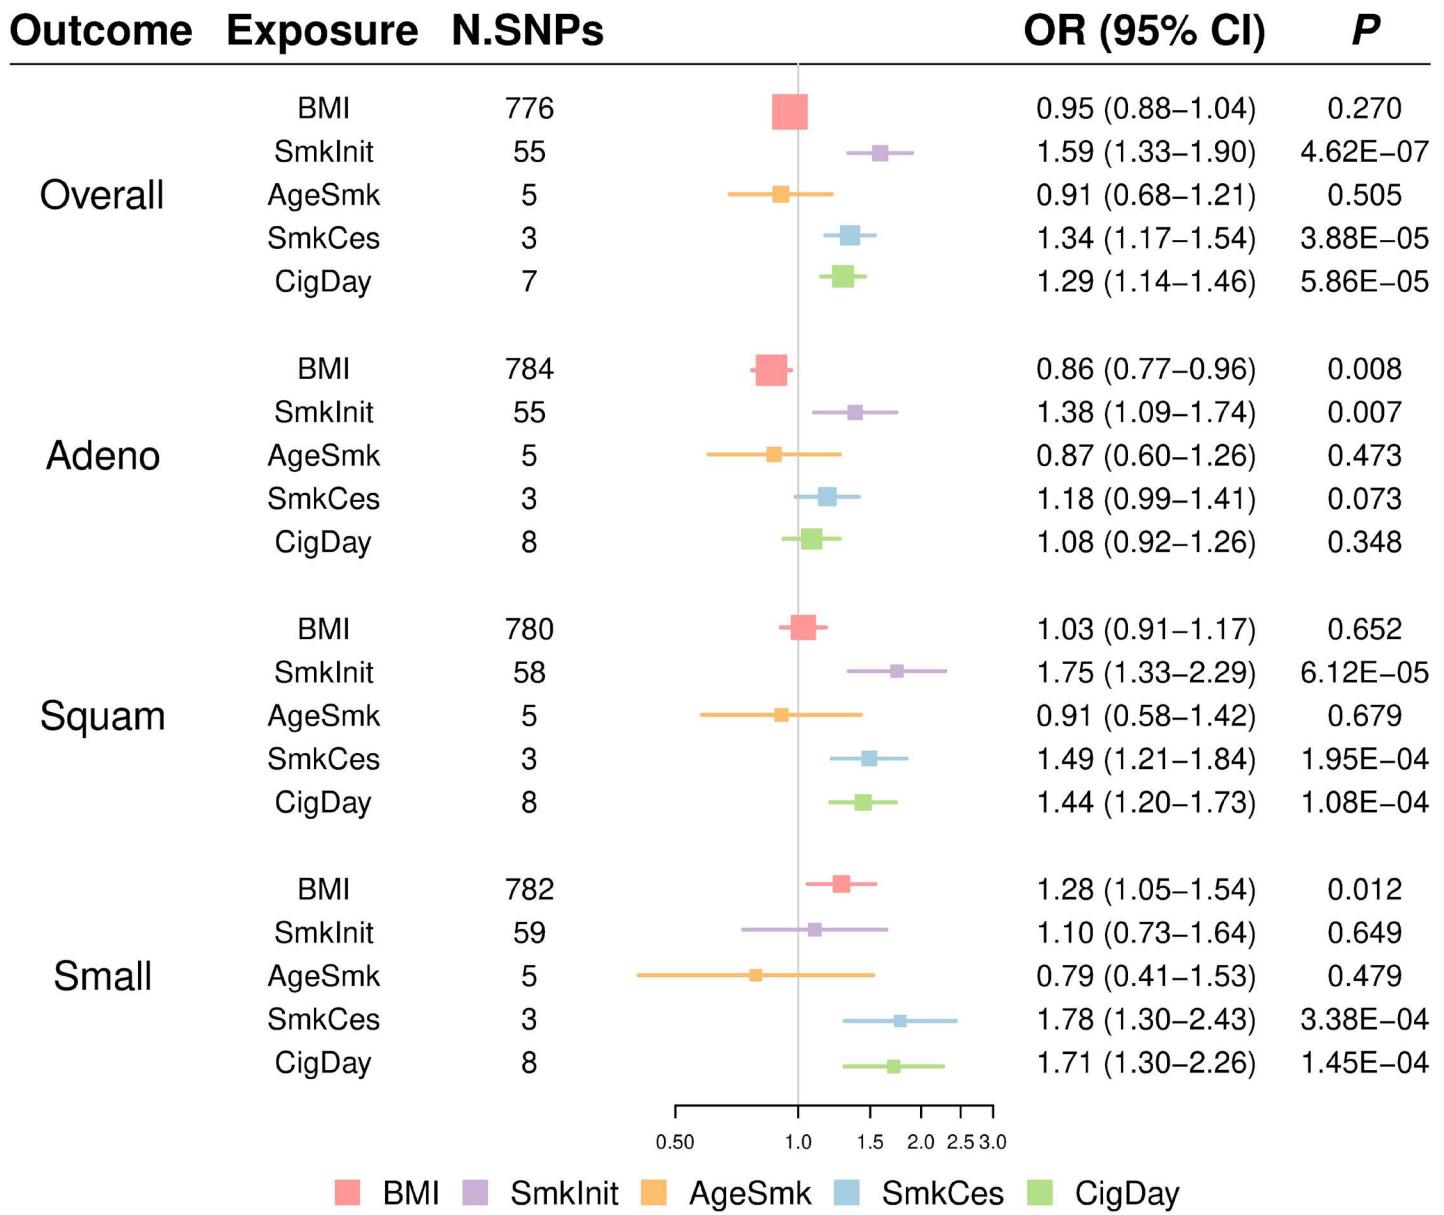

Figure S11. Causal relationships of BMI and smoking phenotypes on lung cancer estimated by multivariable MR Egger. Colors indicate for five exposures: BMI, SmkInit, AgeSmk, SmkCes, and CigDay.
