## The Product Life Cycle: An Updated Review and Future Research Agenda

### Abstract

**Purpose:** This paper responds to calls in academia for an update of the product lifecycle (PLC). Through a systematic literature review, we provide an updated agenda which aims to advance the PLC concept both in research, teaching, and practice.

**Design/Methodology/Approach:** We started by surveying 101 marketing academics globally to ascertain whether a PLC update was viewed necessary and beneficial in the marketing community and thereafter conducted citation analysis of marketing research papers and textbooks to ascertain PLC usage. The subsequent literature review methodology was split into two sections. First, 97 empirical articles were reviewed based on an evaluative framework. Second, research pertaining to the PLC determinants were assessed and discussed.

**Findings:** From the results of our review and primary data from marketing academics, we find that the method of predicting the PLC based on past sales has been largely unsuccessful and perceived as somewhat outdated. However, a new stream of PLC literature is emerging which takes a consumer centric perspective to the PLC and has seen more success at modelling lifecycles in various industries.

**Research Limitations/Implications:** First, the study outlines the most contemporary and successful methodological approaches to modelling the PLC. Namely, the use of artificial intelligence (AI), big data, demand modelling, and consumer psychological mechanisms. Second, it provides several future research avenues using modern market trends such as sustainability, globalization, digitization, and Covid-19 to push the PLC into the 21<sup>st</sup> century.

**Originality/Value:** The PLC has shown to be resolutely popular in management application and education. However, without a continued effort in academic PLC research to update the knowledge around the concept, its use as a productive management tool will likely become outdated. This article provides a necessary and comprehensive literature update resulting in actionable future research and teaching agendas intended to advance the PLC concept into the modern market context.

**Keywords:** product lifecycle; PLC, strategy; research agenda

**Paper Type:** Literature Review

## 1. Introduction

The product lifecycle (PLC) has been a steadfast tool used in practical decision making (Cox, 1967; Levitt, 1965) and marketing education for decades. It contains an implicit structure of a product's time on the market which allows the determination of product strategies depending on the lifecycle stage (Kotler, 2015). The importance and influence of the PLC concept to these domains remain extensive today, as shown by the framework's consistent presence in marketing textbooks over time and in the consistent, if not growing, volume of PLC citations. It appears then, that the PLC is here to stay. However, much academic PLC research was conducted in the 90s and could therefore appear less relevant to today's context, creating a juxtaposition between what is known about the PLC and what is disseminated about it in teaching and research. Therefore, if PLC teaching and research is going to continue to be disseminated, then an update to improve its relevance, managerial applicability, and theoretical contribution is paramount.

To shed further light into the issue and get a better understanding regarding the general academic marketing community's perspective on the PLC's current state in education and research, we surveyed 101 marketing academics globally and carried out a comprehensive content analysis of published marketing textbooks<sup>1</sup> and citation analysis of published PLC articles (Figure 1). The content and citation analyses present a persistent presence of the PLC throughout recent years, indicating that the concept has been, and still is, a key component in today's business and marketing education.

---Figure 1 here---

---

<sup>1</sup> Marketing textbooks were included in analysis on the basis of having over 1000 Google Scholar citations and being in the general area of marketing and its subdomains. This resulted in 45 textbooks being analyzed. The number of pages that were related to PLC was counted for each textbook. The results showed that this number, on average, is around 1-1.5 pages with a stable trend over time.

With regards to the global academician survey, our sample was diverse in geographical areas covered (Europe: 64%, North America: 34%, Other: 3%), and inclusive in terms of breadth of academic positions (PhD Student: 8.8%, Entry Level Faculty: 35.3%, Associate Professor/Senior Lecturer: 22.5%, Professorial: 33.3%). We specifically asked the marketing academics about their attitudes towards the PLC for research and teaching, and the advantages and disadvantages of the framework.

The survey results reveal that current marketing academics see the PLCs merit both in research and teaching. In research terms, over 90% of academics consider the PLC managerially and theoretically relevant (Figure 2). Over 95% agree the PLC is relevant, interesting, useful, and easy to understand for students in teaching (Figure 3). Academics also perceived greater advantages to the PLC than disadvantages (Figures 4 and 5), with an average of 86.3% agreeing the PLC is parsimonious, simple, managerially applicable, and describes well real-life practice, whereas a relatively smaller proportion (54%) agree the PLC cannot predict what will happen in the future, has inconsistent levels of analysis, cannot be applied to different industries, and cannot offer generalizable conclusions.

In line with the usability marketing academics afford the PLC, we also find that most academics intend to continue using it both in research (57.8%) and teaching (90.2%) (Figures 2 and 3). Most crucially, however, marketing academia appears to agree the PLC is outdated in its current state (72.5%) and warrants greater attention, with 75.2% indicating a critical literature review on the PLC as a valuable future direction. These findings have three key implications. First, we find that marketing academics see merit in the PLC as a marketing tool both in teaching, theory, and practice. Second, that they consequently intend to continue using the PLC both in teaching and research. Third, marketing academia also note that a knowledge vacuum exists between what is known about the PLC and how it is currently used, and as such, that it needs attention and update.

8 In response to these calls, the current study aims to provide a foundation for a  
9  
10 reinvigoration of the PLC research stream. To understand the best steps forward in any research  
11  
12 stream, it is important to first understand its past (Palmatier et al., 2018). As such, we provide  
13  
14 a review of extant literature which identifies the PLC's main issues which may have halted its  
15  
16 progression as a marketing framework. We then suggest how these issues can be addressed to  
17  
18 bring the PLC up to date. By doing so, we offer at least four significant contributions to extant  
19  
20 knowledge.  
21  
22

23  
24 First, our article utilizes evaluative criteria in line with other recent reviews (e.g.,  
25  
26 Morgan *et al.*, 2019; Paul *et al.*, 2017) to provide an updated and more rigorous overview of  
27  
28 the current literature. Despite being highly informative and moving the field forward  
29  
30 significantly, existing review articles published on the PLC (e.g., Day, 1981; Rink *et al.*, 1979)<sup>2</sup>  
31  
32 are nearly half a century old and employ a narrative review approach. By introducing and  
33  
34 implementing a set of relevant evaluative criteria we sampled 97 papers, in comparison to Rink  
35  
36 and Swan's (1979) 20 papers and Day's (1981) unspecified number.  
37  
38

39  
40 Second, the emergence of social media and digital technology; the shift to greater  
41  
42 retailer power; the prevalence of multinational corporations; and the rise of the  
43  
44 environmentalist movement have all been shown to influence the PLC framework (Bayus,  
45  
46 1994; Bayus, 1992; Stremersch *et al.*, 2010). Thus, by being the first PLC review in 40 years,  
47  
48 we contribute by providing a long-awaited update based on the acknowledged importance of  
49  
50 literature review papers in the academic field (Palmatier *et al.*, 2018) and the particular need  
51  
52 within the PLC domain.  
53  
54

55  
56  
57  
58 <sup>2</sup> A more recent review by Cao and Folan (2012) has been conducted, however, the main aim of their research  
59  
60 was to further the development of the engineering PLC and it was published in an engineering journal. For this  
reason, it is not viewed as a core PLC literature review in the marketing domain.

1  
2  
3 Third, the PLC was initially created to be used as a managerial tool (Hofer, 1975). As  
4 such, its ability to offer specific managerial recommendations and strategic directions is  
5 important (Moon, 2005). This review contributes by creating a comprehensive PLC  
6 determinants model, developed from earlier models (Lambkin *et al.*, 1989), which structures  
7 determinants (factors that determine the end, beginning, or duration of PLC stages) into  
8 meaningful categories and allows for the identification of areas lacking in empirical research,  
9 or containing inconsistent empirical results. Thus, the third contribution is the proposal of a  
10 PLC determinant framework to structure and generate managerial directions and  
11 recommendations for further research into PLC strategies.

14  
15  
16  
17  
18  
19  
20  
21  
22

23  
24 Fourth, our recommendations for future research contribute to existing knowledge by  
25 providing an actionable roadmap of future research avenues. Specifically, review results show  
26 one of the main issues hindering PLC research is the inability for currently applied methods to  
27 model the PLC as a predictive framework. As a remedy, we provide three methodological  
28 approaches to the PLC (AI and big data, demand modelling, and consumer psychological  
29 mechanisms) which, we argue, will increase its predictive power. We also provide several  
30 specific research questions which apply the PLC to contemporary marketing trends in order to  
31 explicitly pave the way for this updated stream of literature.

## 45 **2. Review Methodology**

46 The analysis of previous literature took two forms. The first was an analysis of methodological  
47 issues related to the PLC framework. These were identified via preliminary search of the PLC  
48 literature and published reviews (Cao *et al.*, 2012; Day, 1981; Dhalla *et al.*, 1976; Lambkin *et*  
49 *al.*, 1989; Rink *et al.*, 1979; Tellis *et al.*, 1988; Wood, 1990). From this, nine criteria (further  
50 discussed in section 3.1) were used as a framework to form the basis of the review. The full  
51

53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 analysis was carried out primarily by use of the search engine Google Scholar. Keywords used  
4  
5 were phrases such as *product life cycle*; *product growth*; *product cycle*.  
6  
7

8         Once this process was exhausted, further studies were mined from reference lists of  
9  
10 papers found in the initial search. The procedure concluded in the analysis of 97 empirical  
11  
12 papers from a range of peer-reviewed journals. Studies presented in conferences, unreviewed  
13  
14 journals or other sources were excluded (cf. Paul *et al.*, 2017). The articles found were mainly  
15  
16 in the areas of marketing, management, and economics. Journals of rated three or higher,  
17  
18 according to the Academic Journal Guide Rankings (Chartered ABS, 2021), made up 90% of  
19  
20 the sample; see Table 1 for a full list of all journals used in the analysis as well as the  
21  
22 distribution of each journal according to decade.  
23  
24  
25

26         As shown in Table 1, the Journal of Marketing contributed the highest number of  
27  
28 articles<sup>3</sup>. In total, 131 authors contributed to the 97 articles, with very little overlap. Articles  
29  
30 were deemed eligible on four criteria; (1) they were empirical articles investigating the  
31  
32 outcome of an independent variable (IV) on a dependent variable (DV), (2) they were published  
33  
34 between the years of 1960-2020, (3) they were in peer-reviewed journals, and (4) they either  
35  
36 explicitly or implicitly related to the PLC.  
37  
38  
39

40         Although it is noted that there are several theoretical articles on this topic, we chose  
41  
42 only to include empirical studies in this section as its purpose is to review PLC methodologies.  
43  
44 Theoretical PLC papers are discussed in depth in later sections. The article analysis begins in  
45  
46 1960 because this is approximately the time when this concept began to be investigated (Rink  
47  
48 *et al.*, 1979).  
49  
50  
51

52         The second framework reviews the determinants of the PLC and its stages. We  
53  
54 reviewed the 97 studies in the evaluative framework to identify the articles pertaining to an  
55  
56 investigation of PLC determinants specifically. As such, the selection criteria remained  
57  
58  
59

---

60 <sup>3</sup> The large number of articles in the Journal of Marketing is partly due to a special edition on the PLC in 1981

1  
2  
3 consistent. Studies were deemed to examine determinants of the PLC if they investigated the  
4 relationship between an IV and a DV of the PLC shape or length at one or all stages. From this,  
5  
6 relationship between an IV and a DV of the PLC shape or length at one or all stages. From this,  
7  
8 25 articles were identified and analyzed. Dependent variables used and the frequency of usage  
9  
10 were as follows; ROI/ROA/ROE (n=7), unit sales (n=5), market share (n=5), growth hazard  
11  
12 (n=3), profit (n=3), and product take-off (n=2).  
13

14  
15 --- Table 1 here ---  
16  
17

### 18 **3. Evaluative Framework**

#### 19 *3.1. Table of Definitions*

20  
21 The choice of criteria are as follows. First, the centrality of concept denotes the extent to which  
22 the PLC is referred to in the study. A central study investigates the PLC or uses the PLC directly  
23 in the investigation, whereas a peripheral study implicitly uses the underlying framework of  
24 the PLC without explicit reference. Studies relating to the diffusion of innovation (DOI)  
25 concept were classified as peripheral to the PLC; although they use a similar shape, they offer  
26 a distinct theoretical rationale, and the PLC is not often explicitly referenced.  
27  
28  
29  
30  
31  
32  
33  
34  
35

36  
37 Second, the categorization of themes was adapted from Cao *et al.* (2012). Their  
38 framework was assessed to establish a timeframe of the major thematic aims throughout the  
39 decades. For example, it was assumed validation would be more prevalent closer to the  
40 introduction of the PLC, whereas modification and usage were more likely investigated once  
41 the concept was well established.  
42  
43  
44  
45  
46  
47

48  
49 Third, previous literature reviews have cited the need for more research of industrial  
50 products (Anderson *et al.*, 1984; Rink *et al.*, 1979). The inclusion of the classification of  
51 consumer and industrial product type in the framework aims to assess whether this issue has  
52 been addressed in more recent articles.  
53  
54  
55  
56

57  
58 Forth, due to the dynamic nature of the PLC, a longitudinal design has been  
59 recommended in previous research (Anderson *et al.*, 1984). The classification of research  
60

1  
2  
3 design aims to assess whether the propensity for the recommended longitudinal design is  
4  
5 apparent in the literature.  
6

7  
8 Fifth, product aggregation refers to the level of specificity to the product. Typically, in  
9  
10 the PLC literature, these are split into class, form, and brand (Rink *et al.*, 1979). However, after  
11  
12 a review of the literature, firm-level analysis was added to the evaluative framework since a  
13  
14 multitude of studies investigates the PLC from a firm level (e.g., Catry *et al.*, 1974; Karakaya  
15  
16 *et al.*, 2007; Wells, 1968).  
17  
18

19  
20 Finally, the stage of the PLC was analyzed to ascertain whether there is a proclivity in  
21  
22 the literature to investigate certain stages more than others. The definition of stages is  
23  
24 deliberately vague and theoretical in order to be inclusive of all papers. The stages were coded  
25  
26 using Anderson and Zeithaml's (1984) categorization, although this classification in itself is  
27  
28 disputable and will be discussed in later sections. Table 2 provides a list of definitions for the  
29  
30 criteria used for setting up the evaluative framework and Table 3 provides the framework itself.  
31  
32

33 --- Tables 2 and 3 here ---  
34  
35  
36  
37

### 38 3.2. Results

#### 39 3.2.1 Data Collection

40  
41 The evaluative framework found that the majority of PLC studies are longitudinal (66%).  
42  
43 Anderson *et al.* (1984) contend that longitudinal research addressing the long-term effects of  
44  
45 specific strategies is crucial in understanding the PLC. However, to date, long-term *primary*  
46  
47 research in this area has not been undertaken, as illustrated in the fact that 71% of all studies  
48  
49 rely on historical data. Therefore, although such data is useful in tracking the success of  
50  
51 strategies at the point of data collection, it sheds little light on the long-term effects of these  
52  
53 strategies. Such reliance on historical databases has been critiqued previously (Thorelli *et al.*,  
54  
55 1981), leading to the recommendation for the use of primary longitudinal data in future studies.  
56  
57  
58  
59  
60

### 3.2.2. Theme and Context

Early validation results proved positive for the rigor of the PLC. Several studies found that the life cycle shape was essentially consistent across product categories, although they proposed slight modifications based on the context of each category (Polli *et al.*, 1969; de Kluyver, 1977; Mercer, 1993).

The modification of the PLC has been undertaken from two perspectives. First, the PLC has been modified theoretically in an attempt to address the criticisms waged against it (Enis *et al.*, 1977; Tellis *et al.*, 1981). Second, due to the appealing simplicity of the concept, it has been extended to other areas of the value chain, for example; the international lifecycle (Wells, 1968), the design life cycle (Newcomb *et al.*, 1998), the manufacturing lifecycle (Lau *et al.*, 2000), and the technology lifecycle (Popper *et al.*, 1992).

By far the most researched area of the PLC, is its application to other industries and contexts (82%). Table 4 highlights the variety of industries which the PLC has been applied to. From this and Table 3, it is apparent consumer durables have been investigated most heavily in contrast to Rink *et al.* (1979) who identified twelve consumer non-durable studies and nine consumer durable studies. This shift may be due to the nature of certain types of products lending themselves better to PLC research. However, it has led to a gap in the investigation into certain types of products. For example, FMCG goods, fashion lifecycles, or technology (online) lifecycles.

In all but one time period (1970-1980), industrial products were investigated considerably less than consumer products. This may be based on the inapplicability of the PLC to industrial products due to differences in marketing strategies and lifecycle lengths (Thorelli *et al.*, 1981). It is argued raw materials are more likely to have a longer, more stable lifespans because they are less susceptible to marketing strategies and consumer demand (Thorelli *et al.*, 1981). However, research into industrial product categories has still been conducted, with

1  
2  
3 interesting results in some cases (e.g., de Kluyver, 1977; Popper *et al.*, 1992). From these  
4  
5 studies, it seems clear that the traditional PLC shape falls short in the conceptualization of  
6  
7 industrial products and adaptations to specific industries may be needed. Although such work  
8  
9 has been carried out to a limited degree, it may still be an area of interest in further research.  
10  
11

12 --- Table 4 here ---  
13  
14  
15  
16

### 17 3.2.3. Product Aggregation

18  
19 As yet, there is little consensus as to which level of product aggregation bears the closest  
20  
21 approximation to the PLC. Certain studies finds that product forms provide the most reliable  
22  
23 PLC shape (Polli *et al.*, 1969; Rink *et al.*, 1979), while some argue for product classes  
24  
25 (Lambkin *et al.*, 1989), and others brands (Enis *et al.*, 1977).  
26  
27

28  
29 Although this debate is still unresolved it is apparent from the evaluative framework  
30  
31 that the majority of studies (59%) are investigating the PLC from a product class level. While  
32  
33 product class appears to be a good contingency in less obvious cases, due to the influences of  
34  
35 strategic differentiation shown in the evolution of the market (Bayus, 1994), the lack of  
36  
37 consensus does not need to create a damning issue for the PLC concept. Rather, it may be a  
38  
39 point of consideration for authors to understand the characteristics and influence product  
40  
41 aggregation may have on the PLC shape and length. It seems unnecessary to identify which  
42  
43 level of aggregation has the closest approximation to the PLC shape when the PLC is intended  
44  
45 to be used to understand these fluctuations, rather than a prescriptive shape that researchers  
46  
47 must seek to find.  
48  
49  
50  
51

### 52 3.2.4. Stage and Measurement

53  
54 Setting aside the DOI literature (introduction and growth stages), the stages are investigated  
55  
56 equally frequently. Most take a holistic approach in which an independent variable is tested  
57  
58  
59  
60

1  
2  
3 throughout all stages of the product's life (e.g., Anderson *et al.*, 1984; Cox, 1967; Thietart *et*  
4 *al.*, 1984) or the shape of the PLC is tested as a whole entity (e.g., Bayus, 1994). However,  
5  
6 some stages are tested independently. This is the case commonly with regard to DOI literature,  
7  
8 which, by nature, only investigates the introduction and growth stages. Due to the wealth of  
9  
10 DOI literature, the maturity and decline stages have been investigated less extensively as  
11  
12 independent entities, with some notable exceptions (i.e., extension strategies and replacement  
13  
14 cycles). This may provide an opportunity for further research into these stages in order to match  
15  
16 the level of understanding achieved in regard to introduction and growth, especially as  
17  
18 extending the product's life is often a key aim from a managerial perspective.  
19  
20  
21  
22

23  
24 The review further found inconsistency in the measurement and categorization of PLC  
25  
26 stages, corroborating earlier findings (e.g., Cao *et al.*, 2012; Rink *et al.*, 1979). The stages are  
27  
28 measured in several ways depending on the type of data available to the researcher, the purpose  
29  
30 of the study, and the aggregation and type of product being investigated (see Table 5).  
31  
32

33 ---- Table 5 here ---  
34  
35  
36  
37

38 The lack of consensus signifies a lack of clarity between stages, thus creating a  
39  
40 consistency problem. This, according to Grantham (1997), limits the PLC's utility as a  
41  
42 forecasting tool. Not only does the lack of clarity create issues for forecasting, but it also makes  
43  
44 ascertaining the current stage of a product difficult. As argued by Rink *et al.* (1979), attempting  
45  
46 to assign the stage of a product purely on sales information is flawed due to the variations in  
47  
48 PLC shapes. However, as shown in the evaluative framework, financial indicators are still  
49  
50 being used in most studies (58%), even though it is difficult for researchers to estimate the unit  
51  
52 sales increase and length of the PLC using retrospective sales data. Some researchers have  
53  
54 sought to remedy the issue by using modelling, identification of early indicators, or pre-test  
55  
56 data to predict stage transitions (e.g., Huang *et al.*, 2008; Orbach *et al.*, 2014). The use of  
57  
58  
59  
60

1  
2  
3 modelling has proven popular, especially in the DOI literature. This may be a more successful  
4 method of predicting transitions of PLC stages, as various studies have proven. Bass (1969)  
5 found a product growth model that could be used to successfully predict lifecycle development.  
6  
7 The method has been used in numerous studies since (e.g., Mahajan *et al.*, 1979; Norton *et al.*,  
8 1987; Srivastava *et al.*, 1985), with varying degrees of success. As indicated by Table 3, the  
9 use of modelling methods has remained relatively popular, and may provide a solution to the  
10 issue of prediction using retrospective data.

## 22 **4. Determinants Framework**

### 23 *4.1. Determinants Model*

24  
25 At the inception of the PLC model, greater attention was directed towards finding a PLC shape  
26 universal to all product types. Once apparent that a universal shape was pragmatically  
27 unrealistic, focus turned to identifying the factors causing variety in the shapes of PLCs across  
28 product categories (Rink *et al.*, 1979). In fact, Lambkin *et al.* (1989) argue that the second most  
29 important step to understand market evolution, after determining unit of analysis, is to  
30 understand the factors effecting the sales trend, thus addressing the issue of determinism  
31 enshrined within the model. The causative nature of the PLC can be viewed from two  
32 perspectives.  
33  
34  
35  
36  
37  
38  
39  
40  
41  
42  
43

44  
45 First, the PLC stage can be seen as the variable that determines which strategies are  
46 undertaken. However, issues have been raised with this perspective. Primarily, such a  
47 viewpoint gives rise to the criticism that the use of the PLC in marketing strategy formulation  
48 can create a “self-fulfilling prophecy” (Wood, 1990, p. 151). An example would be the  
49 managerial implementation of a divest strategy in the decline stage of the PLC, initiating  
50 further decline. Various authors have argued such actions cause products to be discontinued  
51 too early when in fact there may be an opportunity for revitalization (Moon, 2005; Wood,  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 1990). In contrast, contemporary studies have taken the viewpoint that the PLC is in fact the  
4 dependent variable; that strategy decisions effect the PLC stages rather than the inverse (Moon,  
5  
6  
7 2005). From this perspective, managers have the power to change the lifecycle of a product  
8  
9  
10 and even reverse apparently declining sales trends. Scholars have therefore proposed methods  
11  
12 to adapt and extend the PLC to transcend its limitations (Cox, 1967; Enis *et al.*, 1977;  
13  
14 Souerwine *et al.*, 1984). Following the latter approach, the continued assessment of  
15  
16 determinant research appears paramount in the development of the PLC field, as previously  
17  
18 contended (Lambkin *et al.*, 1989; Tellis *et al.*, 1981). Consequently, the following section  
19  
20 assesses contemporary research against a previous determinant model to gauge the level of  
21  
22 growth in the area.  
23  
24  
25

26 A well-cited review of PLC determinants by Lambkin *et al.* (1989) concluded with a  
27  
28 framework of market evolution and the factors affecting it. The framework splits determinants  
29  
30 conceptually into three key areas: the resource environment, supply, and demand, before  
31  
32 analyzing current research against this model<sup>4</sup>. Lambkin and Day's (1989) conceptualization  
33  
34 provides the basis for our model, however, an updated adaptation can be found in Figure 6.  
35  
36 The adaptations to the original Lambkin and Day model are based on an attempt to increase  
37  
38 the managerial applicability and contemporary relevance of the model by using more  
39  
40 commonly found concepts. For example, the 'resource environment' is now discussed in terms  
41  
42 of the macro and microenvironment which are familiar concepts for managers.  
43  
44  
45

46  
47 ---- Figure 6 here ---  
48  
49  
50

51 The current model (Figure 6) categorizes the PLC determinants into four categories:  
52  
53 (1) macroenvironmental factors including PEST (political, economic, social, technological);  
54  
55

---

56  
57  
58 <sup>4</sup> The article went on to propose a model based on evolutionary processes, however to maintain the inherent  
59 simplicity of the PLC, this aspect will not be elaborated on in the current review.  
60

1  
2  
3 (2) microenvironmental factors including competitive, industry, and market behavior; (3)  
4 supply side factors including strategic choices, tactical choices (4Ps), resources, and  
5  
6 capabilities; and (4) demand side factors including consumers (market potential, adoption  
7  
8 process, and individual consumer experience).  
9  
10

11  
12 By organizing the review based on conceptually justified categorizations, this study  
13 provides a systematic and focused analysis of the breadth of the PLC research area. In turn, by  
14  
15 adapting an existing framework (Lambkin and Day, 1989) and taking note of the resulting  
16  
17 recommendations at that time, we are also able to establish the development of later work in  
18  
19 addressing the proposed gaps. Therefore, 25 empirical articles were analyzed in relation to the  
20  
21 framework in Figure 6. In addition to the empirical work, a table of determinants proposed by  
22  
23 non-empirical papers can be found in Appendix 1. Table 6 shows the resulting determinants  
24  
25 framework.  
26

33  
34

## 35 *4.2. Results*

### 36 *4.2.1. Macroenvironment*

37  
38 First, in the assessment of macro-level environmental factors, only two factors have been  
39  
40 investigated empirically; governmental mediation and influential bodies. These factors were  
41  
42 tested by Lau (2014) who found governmental mediation has a relatively larger impact than  
43  
44 influential bodies. The constructs consisted of items relating to governmental mediation and  
45  
46 influential bodies. However, when applying the PEST framework, it becomes evident these  
47  
48 types of factors are yet to be investigated comprehensively in relation to the PLC. It may be a  
49  
50 result of the lack of primary longitudinal research necessary to assess environmental factors.  
51  
52 To address such a gap, it may be beneficial to take the approach of work in the global marketing  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 discipline (e.g., Hultman *et al.*, 2009) to incorporate a comprehensive and managerially  
4 relevant understanding of the macroenvironment's influence in future models.  
5  
6  
7  
8  
9

#### 10 4.2.2. *Microenvironment*

11 A similar case can be made for micro-level structures, despite relatively more research  
12 compared to the macro-level, the area is far from comprehensive. Various factors including;  
13 type of industry, stage of industry, competitive processes, and size of the market are proposed  
14 to influence the PLC in conceptual papers (e.g., Day, 1981; Lambkin *et al.*, 1989; Tellis *et al.*,  
15 1981). Similarly, Day (1981) argues younger industries are shown to have slower market  
16 penetration due to lack of industry infrastructure and slower diffusion rates. However, to date,  
17 little progress has been made in addressing these determinants, which are often controlled for  
18 in studies but not explicitly tested. Thus, we support Lambkin and Day's (1989) earlier findings  
19 and continue to recommend to empirically investigate the effect of the industry, the market,  
20 and competitive behavior on a product's success over the PLC stages. Again, a useful  
21 operationalization of these concepts can be found in the global marketing literature (e.g.,  
22 Hultman *et al.*, 2009).  
23

36  
37  
38  
39  
40  
41

#### 42 4.2.3. *Supply*

43 There are several studies investigating the effect of the marketing mix on the PLC. When taking  
44 the perspective that firms can actively regulate the PLC through their strategies, it seems  
45 natural these require the most attention. However, as shown in Table 6, the level of attention  
46 received is not distributed evenly, with product factors generating many more studies than  
47 promotion, price, and distribution respectively. Distribution, in particular, requires further  
48 investigation to understand how supply-chain decisions can affect the duration and success of  
49 each PLC stage, as has been proposed in earlier, non-empirical studies (see Appendix 1).  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 In relation to product studies, the relationship between product quality and success over  
4 the PLC stages has been investigated extensively, and consensus of the positive relationship  
5 between these variables in all stages seems to have been reached. However, the relationship  
6 pattern is weaker in relation to quality of services, which was only positively related to market  
7 share in two stages, with no significant relationship to ROI (Anderson *et al.*, 1984). As the  
8 investigation into both products and services was carried out in the same study, it is likely this  
9 disparity may be a result of the IV. Currently, investigation into the effect of services on the  
10 PLC is limited (Avlonitis *et al.*, 2005; Cohen *et al.*, 1997; Peng *et al.*, 2020). Therefore, it may  
11 be prudent to further investigate this relationship.  
12  
13  
14  
15  
16  
17  
18  
19  
20  
21  
22

23  
24 Regarding price, the relationship between price and product success is debated both in  
25 the current review results and in wider literature (Hall, 1980). Price cutting has been  
26 recommended as a viable tactic in all four stages by two studies (Golder *et al.*, 1997; Thietart  
27 *et al.*, 1984) with the justification that a lower price will represent a competitive advantage and  
28 therefore increase product sales. Golder *et al.* (1997) found that a lower price increases the  
29 market penetration of a product, thus representing success in the introduction and growth stages  
30 whereas Thietart *et al.* (1984) found the use of price cutting will increase the market share of a  
31 firm in the maturity and decline stages.  
32  
33  
34  
35  
36  
37  
38  
39  
40  
41

42 These findings contradict results into the relationship of relative price with ROI and  
43 CFOI (Anderson *et al.*, 1984), of which both show a positive relationship between price and  
44 the respective performance measures. The contradicting findings represent a wider debate into  
45 pricing strategy which contends that successful companies are strict in their adherence to one  
46 of two pricing strategies to differentiate themselves from competition (Hall, 1980). Following  
47 the conflicting findings in the studies evaluated.  
48  
49  
50  
51  
52  
53

54 In relation to other factors within the supply side, the effect of time to market appears  
55 to generate conflicting results. First, González *et al.* (2002) found that an increase in speed to  
56  
57  
58  
59  
60

1  
2  
3 market positively influenced new product success in support of various literature which  
4 contend that cycle time acceleration will increase market competitiveness (Golder *et al.*, 1997).  
5  
6 Conversely, Anderson *et al.* (1984) found an increase in development time would have a  
7  
8 negative effect of ROI in the maturity stage. An explanation for this relationship was omitted  
9  
10 in the study and the result seems to contradict the traditional consensus in the area. Thus it may  
11  
12 be pertinent to explore this relationship further given that there appears to be some undisclosed  
13  
14 boundary conditions at play.  
15  
16  
17  
18  
19  
20

#### 21 4.2.4. Demand

22  
23 Results from our review show that a demand centric approach is becoming an increasingly  
24  
25 popular method of addressing the issue of retrospective sales data. In the past decade, 75% of  
26  
27 articles have used a demand centric approach through DOI theory. The DOI model was first  
28  
29 proposed by Bass (1969) as a way to model growth of a new product or technology through  
30  
31 the timing of adoption. Throughout the years, the original model has been developed to  
32  
33 incorporate the effects of internal (word-of-mouth) communication, external communication,  
34  
35 pricing strategies, advertising, and timing to market (Mahajan, 1990). However, these models  
36  
37 are less able to predict the maturity and decline phases of the lifecycle. Recently, two studies  
38  
39 have sought to remedy this. The first, Ewing *et al.* (2008), employed the consumer mechanisms  
40  
41 of constitutive and symbolic utility to model brand death. The second, Yi *et al.* (2019), used  
42  
43 diffusion and hazard models to model growth and decline. Both represent promising  
44  
45 developments in the demand-side determinant literature.  
46  
47  
48  
49

50  
51 Similarly, frequent recommendations for further research into the demand-side of the  
52  
53 PLC have been proposed in the conceptual literature (see Appendix 1) which range from  
54  
55 consumer psychological mechanisms to market demographics. Therefore, from a review of the  
56  
57 literature, two dominant demand streams seem to have emerged; (1) the use of diffusion models  
58  
59  
60

1  
2  
3 and (2) the use of consumer psychological experience mechanisms. Given that these fields,  
4 especially related to consumer psychological mechanisms, are relatively new to the area, a  
5 potential roadmap for this stream of research will be discussed in the next section.  
6  
7  
8  
9

## 10 11 12 **5. Advancing the PLC Concept**

13  
14 The purpose of this study was to provide the foundation to advancing the PLC concept in light  
15 of marketing academia's recommendation for such an update. We also found there is a  
16 consensus among academics in the specific type of empirical PLC studies they wish to see in  
17 the future. Figure 7 shows most marketing academics believe all research avenues have merit,  
18 however, they believe longitudinal studies using the PLC and applying the PLC across contexts  
19 are the two most valuable future directions, whilst replication studies are the least valuable.  
20  
21 The results of our review are in line with this consensus and will be elucidated henceforth.  
22  
23  
24  
25  
26  
27  
28  
29

30  
31 ---Figure 7 here---  
32  
33  
34

35  
36 Generally, we find that research on the PLC has declined in the last decade despite its  
37 continued popularity as a tool in business education and practice. Our review finds two key  
38 explanations for this trend; (1) despite its intuitive appeal in teaching, the PLC lacks the  
39 methodological foundations which allow it to be operationalized consistently in research, and  
40 (2) due to this lack of practical applicability, an updated research agenda has not been proposed  
41 or conducted, which leads to the perception of the PLC as an outdated framework. We believe  
42 that addressing the first issue will pave the course for addressing the second. Therefore, the  
43 conclusion will, first, provide some concrete methodological suggestions of how to model the  
44 PLC in line with current research developments. Then, once several modelling strategies are  
45 proposed, it will suggest several future research directions which are rooted in the modern-day  
46  
47  
48  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 market. In providing an updated research agenda with both methodological and application  
4  
5 recommendations we aim to pave the way to the advancement of the PLC concept.  
6  
7  
8  
9

## 10 5.2. *Future Research Agenda: Methodologies*

11  
12 Based on our review, it seems the most fundamental issue of the PLC is its inability to predict  
13  
14 product sales and therefore its limited managerial applicability. Clearly to allow the PLC to  
15  
16 persist as a tool, not only in teaching, but in contemporary, managerially relevant research and  
17  
18 practice, this issue needs to be addressed. Early PLC research has relied on the use of past sales  
19  
20 data as a modeling base, however, this is viewed by many as a redundant, uninformative  
21  
22 approach (Hunt, 1976). However, a parallel, increasingly popular approach is to investigate  
23  
24 and model the PLC from the perspective of the customer. From the review of the previous  
25  
26 literature, 3 potential avenues emerge which may use a customer-centric approach to progress  
27  
28 the PLC from an abstract framework to an operationalizable tool; AI and big data, demand  
29  
30 modelling, and consumer psychological mechanisms. Table 7 provides a summary of these  
31  
32 approaches.  
33  
34  
35  
36

37 --- Table 7 here ---  
38  
39  
40  
41

### 42 5.2.1. *Artificial Intelligence and Big Data*

43  
44 AI is primarily used to control and analyze numerical data. One of the key developments of  
45  
46 AI, proposed by Davenport *et al.* (2020), is an increase in its predictive ability. In fact, the use  
47  
48 of consumer analytics to forecast demand has already begun in certain studies (Chong *et al.*,  
49  
50 2017; Zhao *et al.*, 2012). For example, by using customer reviews and online promotional  
51  
52 variables in neural network analysis, Chong *et al.* (2017) were able to forecast the level of  
53  
54 online product demand. Similarly, Calder *et al.* (2016) propose big data can be utilized from a  
55  
56 psychological perspective through sentiment analysis to predict brand engagement levels. This  
57  
58  
59  
60

1  
2  
3 area may be particularly useful for those investigating the brand lifecycle, given that  
4 engagement is shown to predict brand loyalty and purchase intentions (Hollebeek, 2011). The  
5  
6 main implication of this development for PLC research is that long spanning, retrospective data  
7  
8 sets are no longer necessary to predict sales, instead, we are now able to predict the demand of  
9  
10 very new products (Zhao *et al.*, 2012) without the need for extensive sales data to input into  
11  
12 the algorithms.  
13  
14  
15  
16  
17  
18

### 19 5.2.2. Diffusion Models

20  
21 As explained, a pertinent issue with the legitimacy of the PLC as a marketing tool is its inability  
22  
23 to forecast stages. However, one stream of literature which has addressed this issue is the  
24  
25 diffusion literature (e.g., Bass, 1969; Lilien, 1980; Mahajan *et al.*, 1979; Norton *et al.*, 1987).  
26  
27 The DOI literature models customer demand data to predict later PLC stages based on sales,  
28  
29 price, penetration, and repeat and replacement purchase data. The success of this approach is  
30  
31 reflected in the fact that in the past decade, 75% of articles have taken a diffusion perspective  
32  
33 (e.g., Delre *et al.*, 2016; Yi *et al.*, 2019). Therefore, it seems it is now the most expedient  
34  
35 approach to the PLC. Although this research has proved successful, most focus on the growth  
36  
37 stage of the lifecycle. Therefore, an extension of this type of research which takes a demand-  
38  
39 centric approach to the lifecycle (cf. Branstad *et al.*, 2020), especially in the maturity and  
40  
41 decline stages of the PLC, may prove an effective course to revive the PLC concept.  
42  
43  
44  
45  
46  
47  
48

### 49 5.2.4. Consumer Psychological Mechanisms

50  
51 A very small number of studies have taken the consumer centric design a step further by using  
52  
53 consumer psychological concepts to provide a bottom-up approach to the PLC (e.g., Ewing *et al.*,  
54  
55 2009). In the same way as the diffusion literature, this type of literature seeks to predict the  
56  
57 product demand, and therefore the resulting PLC. However, rather than a modelling approach,  
58  
59  
60

1  
2  
3 this literature attempts to understand the psychological mechanisms that explain and predict  
4 the dynamics of a consumer's relationship with a product moving forward. This approach  
5 would appear to have theoretical merit, with many psychological relationship concepts proving  
6 effective in predicting various brand outcomes (Batra et al., 2012; Malär et al., 2011). In  
7 addition, it is less restricted than diffusion/demand modelling in terms of PLC stage, product  
8 type, product novelty, and supply restrictions (cf. Mahajan et al., 1990). However, to make  
9 substantial developments to the PLC literature generally, the approach must be applied more  
10 widely to different market contexts.

11  
12 In order to provide more concrete suggestions on how a customer-centric perspective  
13 can be used to predict the PLC, we conducted a review of relevant literature on factors that  
14 cause changes in consumer-brand relationships. By doing this, we aim to consolidate rationale  
15 in the areas of consumer branding and lifecycle research to provide an indication of possible  
16 consumer centric predictors of the PLC. The results of which can be found in Table 8.

17  
18 --- Table 8 here ---

36  
37

38 In light of our review, we propose that the psychological mechanisms which affect  
39 lifecycle trajectory can be split into two sections: functional and symbolic. Functional appraisal  
40 contains rational factors which evaluate the product/brand based on the benefits/costs provided.  
41 Each of these mechanisms has been demonstrated to have an effect on a number of relational  
42 outcomes such as commitment, attachment, and relationship continuance, and could therefore  
43 act as a proxy to the PLC stages – particularly the maturity and decline stages.

44  
45 From the review, we also find other frameworks of relationship or lifecycle change  
46 proposed in the literature in B2C and B2B contexts, which we suggest may also provide helpful  
47 recommendations for the future of the consumer centric PLC approach (Harmeling *et al.*, 2015;  
48 Zhang *et al.*, 2016). In summary, we provide suggestions of factors which are indicated to be  
49

2  
3 related to dynamic change in a lifecycle of a product or brand at customer level. To create a  
4 predictive framework of the PLC from a customer perspective in the future, we would suggest  
5 a longitudinal design to test the proposed mechanisms. Potential operationalizations for such a  
6 study may follow methods similar to Harmeling *et al.* (2015) and Zhang *et al.* (2016).

### 15 *5.3 Future Research Agenda: Application*

16  
17 As previously stated, a key issue hampering the PLC is the dearth of up-to-date literature. The  
18 majority of the PLC research was conducted in the 90s, however, a shifting global market and  
19 consumer trends mean firms are competing in a vastly changed landscape from 30 years ago.  
20  
21 Despite market developments, conceptual adaptations of the PLC have lagged behind, with the  
22 original PLC proposed in the 60s still being taught, as shown from our survey results and  
23 textbook analysis. In addition to the lack of up-to-date literature, we find in the evaluative  
24 framework that investigations into macroenvironmental factors have lagged behind other  
25 research streams. Therefore, we propose several ways in which the PLC tool could be applied  
26 to topical market trends, and why the use of this framework will not only improve the  
27 framework itself but also provide unique insights into the different phenomena.

#### 42 *5.2.1. Online PLCs*

43  
44 The first development in the market, especially since the Covid-19 pandemic, is the consistent  
45 trend towards online markets which has seen global e-commerce sales rise in its share of all  
46 retail sales by 3% (UNNews, 2020). Although e-commerce now has a 19% share of all retail  
47 sales globally, thus far no known studies have investigated the online PLC. Not only is it  
48 important to represent the context of today's market, but the shift to online is likely to have  
49 some interesting theoretical implications for the PLC also. For example, the ubiquity of online  
50 shopping means it is likely to be less affected by physical environmental factors and less reliant  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 on a local customer base, which would imply a longer, more stable PLC. However, the  
4 concentrated competition in the online marketplace is shown to cause less customer loyalty for  
5 certain brands (Danaher *et al.*, 2003). Therefore, the effect of online versus offline on the  
6 relative PLC is yet to be determined and seems to be an avenue worth investigating further.  
7  
8  
9

10  
11  
12 The e-commerce trend is also giving rise to another market trend; subscription services.  
13 Previous research has shown the consumption patterns of subscription services is vastly  
14 different to traditional products (McCarthy *et al.*, 2017). Compared to non-subscription  
15 offerings, the subscription business models entail a greater customer investment at initial sale,  
16 but would likely generate greater stability with repeat purchases and more resistance to  
17 negative shifts and termination of the transaction. The ultimate aim of subscription services is  
18 to increase customer retention, but does this translate to more stable lifecycles? Does the  
19 contractual obligation associated with subscription services improve customer loyalty in the  
20 case of brand transgressions, or do customers resent the contractual relationship when things  
21 go wrong? And what effect does this have on a brand's lifecycle? The context of e-commerce  
22 lends itself to investigations using online reviews, social media data, and online behavior to  
23 further understand how the PLC behaves in the e-commerce context. Some studies, such as,  
24 Chevalier *et al.* (2006) have begun to use online reviews to forecast online sales behavior, and  
25 have found interesting results in relation to how customer reviews relate to sales over time.

### 56 5.3.2. Global Versus Local PLCs

57  
58  
59  
60

1  
2  
3 The second major development in the market affecting the PLC is globalization (and more  
4 recently anti-globalization) (Witt, 2019). At this point of potential divergence in the global  
5 landscape, what effect does culture and country have on the PLC? Extant research has found  
6 cultural differences with regards to brand loyalty (Palumbo *et al.*, 2000), brand equity (Yoo *et*  
7 *al.*, 2002), and purchase behavior (Kim *et al.*, 2002). Consequently, the implications of culture  
8 on the PLC may be significant, especially given the different macro and microenvironments  
9 that products exist in globally.

10  
11  
12  
13  
14  
15  
16  
17  
18  
19 As a result of the difference in global and local marketplaces, it may also be fruitful to  
20 assess the implications of global vs local firms on the PLC. Research has shown global brands  
21 are generally more technologically innovative and adaptive whereas local brands are more  
22 embedded in local markets and communities, have stronger ties to the past and cover niche for  
23 longer periods (Sichtmann *et al.*, 2019). As such, it seems likely that local brands have  
24 comparatively longer brand cycles than global brands. Therefore, investigating whether  
25 customer dispositions toward globalization or ethnocentric tendencies (Balabanis *et al.*, 2004)  
26 shorten or extend the lifecycles of global and local products would be worthwhile.

27  
28  
29  
30  
31  
32  
33  
34  
35  
36  
37 Although the way in which country of origin strategies interact with PLC stages has  
38 been addressed in previous research (Niss, 1996), another interesting area in relation to the  
39 PLC may be the use of standardization vs adaptation strategies. Results from Anderson *et al.*  
40 (1984) showed an effect of PLC stage on the success of an adaptation strategy. But given the  
41 prevalence of this strategy in global markets, understanding its implications would represent a  
42 meaningful development in PLC research. Would these results translate to the global  
43 marketplace? Given that Anderson *et al.* (1984) found generally negative results, one would  
44 assume that there are significant differences in the interaction of standardization/adaptation  
45 strategies and PLC stages in home and foreign markets, but these are yet to be explored. This  
46 could be done by using each of the three methodological approaches proposed in the previous  
47  
48  
49  
50  
51  
52  
53

2  
3 section, depending on the perspective taken in the study. Previous research shows how AI/big  
4 data (Kushwaha *et al.*, 2021), demand data (Allred & Park, 2007), and consumer psychological  
5 mechanisms (Sichtmann *et al.*, 2019) have all been used in international marketing research so  
6  
7  
8  
9  
10 there is scope for the use of each strategy related to the PLC.

11

18  
19 *international brands?*  
20

### 21 22 23 24 5.3.3. Sustainability and PLCs

25  
26 The third major development in the market is the increased focus on sustainability from both a  
27 consumer and firm perspective. PLC management literature, which focuses on the  
28 manufacturing and engineering perspective of the lifecycle, has provided a myriad of research  
29 in this area (cf. Cao *et al.*, 2012; Shuaib *et al.*, 2014). Unsurprisingly, given the impetus on  
30 slower consumption cycles, firms are advised to focus on providing withstanding, longer  
31 lifecycle products to appeal to the demand for sustainability (Cooper, 2005). What is yet to be  
32  
33  
34  
35  
36  
37  
38

52  
53  
54  
55  
56  
57  
58  
59  
60  
looked at, is the impact of sustainability on the marketing PLC. However, given the insurgence  
of research in this area, it may provide some interesting research ideas. For example, corporate  
social responsibility (CSR) initiatives have shown to increase customer satisfaction (Luo *et al.*,  
2006) and identification (Bhattacharya *et al.*, 2004), which in turn are shown to influence  
customer purchase intention (Keh *et al.*, 2009). Thus, leveraging the sustainability factor may  
lengthen the PLC, but this is contingent on the product's adherence to sustainability initiatives  
such as the banning single use plastics and reducing CO<sub>2</sub>. For products that do not adhere to  
these new initiatives, sustainability may in fact be shortening the PLC. Therefore, future  
research may wish to understand the effectiveness of promoting sustainability dependent on

1  
2  
3 the stage of the PLC and the type of product in their offering. To understand the effect of  
4 sustainability strategies on customer demand at different stages of the PLC, future researchers  
5 may wish to utilize sales and penetration data within their models to forecast future sales trends,  
6  
7  
8  
9  
10 as in Guo (2014).

11  
12 *RQ3a: How does the role of sustainability impact the PLC?*

13  
14 *RQ3b: Should firms aim to elongate their PLC in line with slower consumption cycles?*

15  
16 *RQ3c: Does promotion of elongated product life increase product demand?*

17  
18  
19 *RQ3d: At what stage of the PLC are sustainability strategies most successful?*

#### 20 21 22 23 24 5.3.4. Sharing Economy PLCs

25  
26 One way in which brands are promoting sustainability is through the utilization of the sharing  
27 economy as 76% of consumers believe this strategy is beneficial to the environment (PwC,  
28 2015). The implications of this new business model on the PLC may represent another  
29 interesting avenue for future research. Specifically, the factors which affect the sharing  
30 economy and its PLC appear to be distinct from those of traditional PLCs. For instance, a key  
31 determinant of the PLC traditionally is product/service quality (e.g., Tellis *et al.*, 1988).  
32 However, given the relegated importance of quality in the sharing economy and the firms' lack  
33 of control over it (Eckhardt *et al.*, 2019), the impact of this once key factor is questioned.  
34 Furthermore, Eckhardt *et al.* (2019) argue that the effect of service quality may also be  
35 attenuated in the sharing economy as consumers view failure by other co-consumers less  
36 harshly than from a service provider. Together, this points towards a more stable, lengthier  
37 PLC for the sharing economy. The relatively stable consumer centric benefits of sustainability  
38 and financial benefits provide further evidence for this (Hamari *et al.*, 2016). However, the  
39 increased effect of regulatory factors (Hong *et al.*, 2018) especially given recent issues with  
40 some sharing economy providers (Ghosh, 2019), casts doubt over the seemingly stable picture  
41  
42  
43  
44  
45  
46  
47  
48

52  
53  
54  
55  
56  
57  
58  
59  
60

of the sharing economy PLC. Therefore, the effect of institutional and regulatory factors may present another future research area.

Finally, a key question in consideration of the application of the PLC concept to the sharing economy is what level of product aggregation should this investigation be framed? Are consumers in a sharing economy forming a relationship with the service provider, the brand, or their co-consumers? What are the implications for each lifecycle? Similar questions have been proposed in a review of the sharing economy (Eckhardt *et al.*, 2019), however applying the lifecycle concept to this area may provide the structure needed to organize research on this novel business model. The key premise of the sharing economy is its implication on the stability of the PLC, therefore methodologies using forecasting tools which incorporate demand, similar to the bass diffusion model, may prove most effective (e.g., Guo, 2014) in understanding this issue.

*RQ4a: Are PLCs more stable in the sharing economy?*

*RQ4b: What is the effect of regulatory and institutional factors on the sharing economy PLC?*

*RQ4c: At what level do consumers form a relationship with service providers in the sharing economy (the brand, the co-consumer, the firm)?*

### 5.3.5. Pandemic PLCs

A recent development in the global market which is argued to be one of the most significant environmental changes in modern marketing (He *et al.*, 2020) is the Covid-19 pandemic. The uncertainty of the Covid-19 pandemic has forced brands to adjust their long-term marketing strategies and listen to the customer in real time to adapt their campaigns (Diebner *et al.*, 2020). The agility and emotional connection cultivated in the pandemic pivot has worked well for certain brands and industries (Guillén, 2020). As things steadily return to pre-pandemic

1  
2  
3 conditions, should brands continue to use this improvisation approach or return to their long-  
4 term brand goals? Using the PLC framework could provide a structured method to analyze the  
5 merits of each approach to see if increased agility increases both short- *and* long-term outcomes  
6 and/or if this will change as customer attitudes settle after this turbulent period. Such an  
7 analysis may wish to utilize longitudinal approaches, specifically event study approaches  
8 (Sorescu *et al.*, 2017), to understand and compare the differences in the lifecycles before and  
9 after the pandemic, both in the short- and in the long-term. Studies such as Borah and Tellis  
10 (2014) and Tipton *et al.* (2009) provide examples of such a methodology which may be utilized  
11 in relation to the PLC in the future.  
12

23  
24 *RQ5a: How has the pandemic affected PLCs?*

25  
26 *RQ5b: What are the implications of diverging brand responses to the pandemic crisis*  
27 *(e.g. forced flexibility, short term reactivity, etc.) and how will they affect their PLC's*  
28 *development in the short-, medium- or long-term?*  
29  
30  
31  
32  
33

#### 34 35 *5.4. Future Teaching Agenda*

36 Beyond marketing research, the PLC is commonly used in marketing education and practice.  
37 To understand the state of teaching with the PLC, we reviewed current higher education  
38 textbooks in the main domains of marketing which are relevant to the PLC; introductory,  
39 services, B2B, consumer behavior, international marketing, digital marketing, and marketing  
40 communications textbooks (see note 1). To assess the relative usage of the PLC in each domain,  
41 the percentage of pages dedicated to the PLC was analyzed and the average was calculated for  
42 each domain. The results were as follows; introductory (2.1%), consumer behavior (1.5%),  
43 international marketing (0.9%), digital marketing (0.6%), marketing communications (0.5%),  
44 services (0.5%), and B2B (0.5%).  
45  
46  
47  
48  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 The results are largely as expected, as an introductory framework, the PLC has featured  
4 most in introductory textbooks. However, despite consumer behavior textbooks demonstrating  
5 the second highest percentage of pages dedicated to the PLC, the content is largely devoted to  
6 the DOI literature and, in fact, highlighting the differences between the DOI and PLC. In light  
7 of our findings and recommendations in this review, future teaching may wish to refrain from  
8 such compartmentalization and discuss the implications consumer psychological mechanisms  
9 may have on the strategic decisions of a product's life, as in some extant research (e.g., Ewing  
10 *et al.*, 2008; Yi *et al.*, 2019). The analyzed international marketing textbooks provided arguably  
11 the most integrated use of the PLC in their domain by proposing an adapted international  
12 product lifecycle (IPLC) which was lagged based on the market. They also discussed the  
13 implications of the PLC to trade, exporting, and technology. The international marketing area  
14 may, therefore, pave the way for how the PLC can be integrated seamlessly into a key  
15 marketing domain, although they may still wish to consider the impact of global vs local  
16 lifecycles, and country of origin on the PLC, and integrate this into the relevant frameworks.  
17 Digital marketing, marketing communications, services, and B2B textbooks all utilized the  
18 PLC similarly, dedicating approximately one page to a brief discussion of the framework and  
19 the implications to their area. However, from the discussion presented above in terms of the  
20 sharing economy and digitization, it is clear the PLC has more far reaching and integral  
21 implications than are currently discussed in teaching practice, especially in relation to topical  
22 shifts in the market. In order for the PLC to be viewed as a contemporary framework able to  
23 shape managerial decisions in the modern world it must be considered and taught as such when  
24 it is first introduced.

**Figure 1: Number of Citations of 79 Product Life Cycle Papers from 1990-2020**

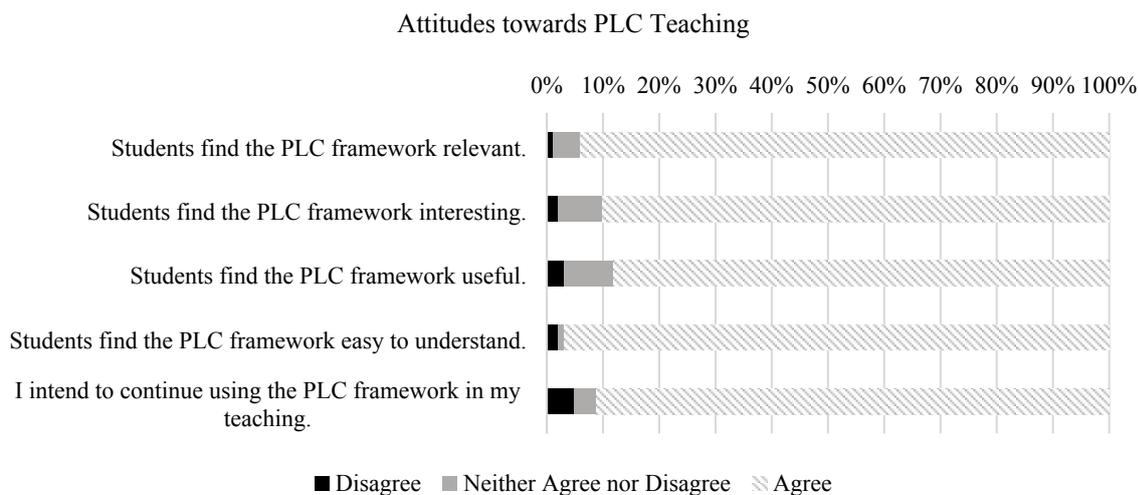

Note: Following precedence in the literature (Ismagilova *et al.*, 2020) citation records were collected on Scopus and Web of Science databases (All 97 articles reviewed in the main literature review were searched for but 18 were unavailable on either database resulting in 79 articles being analyzed. The specific articles analyzed are highlighted in the reference list by an <sup>a</sup> symbol)

<b>Total</b>	<b>97</b>							

**Table 2: Definitions of the Criteria for the Evaluative Framework**

<b>Variables</b>	<b>Definition</b>
<b>Centrality of Concept</b>	
Central	The product life cycle concept was investigated explicitly within the study
Peripheral	The product life cycle concept was implied within the study
<b>Time Horizon</b>	
Historical	Data collected in the past relative to the independent variable
Current	Data representing the same time period as the independent variable
Future	Data produced over a specified future period relative to the independent variable
<b>Theme</b>	
Validation	The purpose of the study is to empirically validate the existence of this phenomena and usefulness as a marketing tool
Issues	Highlighting and testing the issues with the PLC framework
Modification	Modifying the framework to fit with other areas of business/ academia
Usage	Using the framework in different contexts
<b>Industry</b>	
Durable	Products which are not consumed after three years of purchase (e.g. car)
Non-Durable	Products which are consumed within a maximum of three years of purchase. (e.g. toothpaste)
Services	Firms which primarily provide intangible products and services
N/A	The information was unavailable to the researcher/ inapplicable in this study
<b>Customer Type</b>	
Consumer	Products purchased by the end consumer
Industrial	Products purchased by firms to aid in the production of other goods
N/A	The information was unavailable to the researcher/ inapplicable in this study
<b>Research Design</b>	
Cross Sectional	The observation of variables at one point in time
Longitudinal	The repeated observation of the same variables at different points in time
N/A	The information was unavailable to the researcher/ inapplicable in this study
<b>Measurement Referent</b>	
Financial Indicators	The measurement of the product life cycle and its stages consisted of a financial indication e.g. sales, revenue, market share
Non-Financial	The measurement of the product life cycle and its stages consisted of a non-financial indication e.g. managerial reports, consumer demand
Modelling	A model was used to reflect certain aspects of PLC development
N/A	The information was unavailable to the researcher/ inapplicable in this study
<b>Product Aggregation</b>	
Form	The specific product (diet colas)
Class	The generic product category or subcategory (soft drink)
Brand	The brand name (diet Dr Pepper)
Firm	Entire firm product offering
<b>Stage</b>	
Introduction	Primary demand for product just starting to grow, products or services still unfamiliar to many potential users
Growth	Demand growing at 10% or more annually in real terms; technology and competitive structure still changing
Maturity	Products or services familiar to vast majority of prospective users; technology and competitive structure relatively stable
Decline	Products viewed as commodities; weaker competitors beginning to exit

Table 3: Evaluative Framework

Classifier Variable	Total n=97 (%)	Period					
		1960-70 n <sub>1</sub> =8	1970-80 n <sub>2</sub> =10	1980-90 n <sub>3</sub> =29	1990-00 n <sub>4</sub> =14	2000-10 n <sub>5</sub> =24	2010-2020 n <sub>6</sub> =12
<b>Centrality of Concept</b>							
Central	69 (71)	6 (75)	6 (60)	20 (69)	13 (93)	16 (79)	8 (67)
Peripheral	28 (29)	2 (25)	4 (40)	9 (31)	1 (7)	8 (33)	4 (33)

**Table 5: Two comparative stage classifications (Cao and Folan, 2012)**

Phases	Cox (1967)	Polli and Cook (1969)
Introduction	Up to 5000 new prescriptions in a single month	$S_i$ less than 5% of peak sales
Growth	From 5000 new prescriptions in a single month	$S_i$ greater than +0.05
Maturity	From maximum monthly revenue	$S_i$ in the +0.05 to -0.05 range
Decline	Below 20% or 10% of maximum monthly revenue	$S_i$ greater than -0.05

Note:  $S_i$  yearly sales of non-durable  $i$  divided by sales of all non-durables;  $S$  yearly percentage changes in  $S_i$ .
