Combination of Measurements of the Top Quark Mass from Data Collected by the ATLAS and CMS Experiments at $\sqrt{s}=7$ and 8 TeV

A. Hayrapetyan *et al.**

(CMS Collaboration)[†]

(ATLAS Collaboration)[‡]

(Received 13 February 2024; accepted 1 April 2024; published 27 June 2024)

A combination of fifteen top quark mass measurements performed by the ATLAS and CMS experiments at the LHC is presented. The datasets used correspond to an integrated luminosity of up to 5 and 20 fb⁻¹ of proton-proton collisions at center-of-mass energies of 7 and 8 TeV, respectively. The combination includes measurements in top quark pair events that exploit both the semileptonic and hadronic decays of the top quark, and a measurement using events enriched in single top quark production via the electroweak t channel. The combination accounts for the correlations between measurements and achieves an improvement in the total uncertainty of 31% relative to the most precise input measurement. The result is $m_t = 172.52 \pm 0.14(\text{stat}) \pm 0.30(\text{syst})$ GeV, with a total uncertainty of 0.33 GeV.

DOI: 10.1103/PhysRevLett.132.261902

The mass of the top quark (m_t) is a fundamental parameter of the standard model (SM). Its precise measurement provides a crucial input to fits that probe the consistency of the SM [1–5]. The Tevatron experiments CDF and D0 were the first to measure m_t [6,7], and produced a combined result in 2016 [8]. During the 2011–2012 data-taking period of the CERN LHC, proton-proton collisions at $\sqrt{s} = 7$ and 8 TeV produced large numbers of top quarks in pairs via strong interactions or singly via electroweak processes. The two general-purpose experiments at the LHC, ATLAS [9], and CMS [10], performed multiple measurements of m_t using these data [11–24]. In this Letter, a combined m_t measurement from the ATLAS and CMS experiments is published for the first time. The 15 input measurements utilize up to 5 (20) fb⁻¹ of integrated luminosity per experiment at 7 (8) TeV. A detailed estimate of the correlations between the ATLAS and CMS measurements is performed and the measurements are combined using the best linear unbiased estimate (BLUE) method [25,26]. Not included in this combination are recent measurements of m_t performed with a partial 13 TeV dataset [24,27–33], for which the correlations have not yet been studied in detail. These measurements include new analysis techniques and the most precise measurement

to date, made by CMS, with an uncertainty of 0.37 GeV [33].

The final state of events containing top quarks is determined by the decay of the W bosons produced in the top quark decays. In the top quark pair ($t\bar{t}$) production mode, ATLAS and CMS have made measurements in the dilepton ($t\bar{t} \rightarrow \ell^+ \nu b \ell^- \bar{\nu} \bar{b}$), lepton + jets ($t\bar{t} \rightarrow \ell^+ \nu b q \bar{q}' \bar{b}$), and all-jets ($t\bar{t} \rightarrow q \bar{q}' b q \bar{q}' \bar{b}$) channels. In addition, CMS has performed a measurement using single top quark ($t \rightarrow \ell^+ \nu b$, $\bar{t} \rightarrow \ell^- \bar{\nu} \bar{b}$) events.

In the dilepton channel, ATLAS uses the average invariant mass of the two lepton and b -tagged jet pairs as the observable sensitive to m_t [15,18], where a b -tagged jet is any reconstructed jet identified as being likely to originate from a b quark. At $\sqrt{s} = 7$ TeV, CMS uses a kinematic reconstruction with the analytical matrix weighting technique [12] and at $\sqrt{s} = 8$ TeV CMS performs a fit to two dedicated observables [22] to simultaneously extract m_t and the global jet energy scale (JES). In the lepton + jets channel [11,15,16,23], both experiments perform a kinematic fit on an event-by-event basis to reconstruct the top quark mass and the invariant mass of the hadronically decaying W boson. The latter is used to constrain the global JES. In addition, ATLAS fits a scale factor for the relative JES between jets originating from b quarks (b quark jets) and light quark or gluon jets [15,23]. For the all-jets channel, ATLAS uses the ratio of the reconstructed top quark mass to the reconstructed W boson mass [14,20] to extract m_t , while CMS fits the reconstructed top quark mass [13] directly, and at 8 TeV exploits the larger data sample to constrain the global JES using the reconstructed W boson mass [16].

The CMS single top quark analysis fits the invariant mass of the lepton, neutrino, and b -tagged jet [21] to extract m_t . Two additional CMS measurements [17,19] use observables built only from leptons and charged-particle tracks, resulting in m_t measurements with low sensitivity to the JES uncertainties. The J/ψ analysis uses the invariant mass of the lepton and the two muons from the J/ψ meson decay [19]. The secondary vertex analysis uses the invariant mass of the lepton and the charged particles from a displaced secondary vertex [17]. Both measurements use $t\bar{t}$ events from the dilepton and lepton + jets decay modes.

All m_t measurements are calibrated using Monte Carlo (MC) simulation. Matrix element (ME) calculations are performed at fixed order in quantum chromodynamics (QCD) and interfaced to a parton shower (PS) algorithm that provides resummation of soft and collinear QCD radiation and a hadronization model that simulates the nonperturbative formation of hadrons. The POWHEG [34–36] generator at next-to-leading-order (NLO) in the strong coupling constant is interfaced with PYTHIA6 [37] to simulate $t\bar{t}$ production in the ATLAS measurements. The CMS measurements use the MadGraph5 [38] generator, which includes leading-order (LO) terms for $t\bar{t}$ production with up to three additional partons, also interfaced with PYTHIA6. The top quark mass is a renormalization-scheme-dependent parameter in perturbative quantum field theory. The precise identification of the m_t parameter in MC simulations within a field-theoretic mass scheme is the subject of theoretical studies [39–42].

The BLUE method defines the estimator $m_t = \sum_i w^i m_t^i$ for the input measurements m_t^i . The weights w^i are determined by minimizing the uncertainty in m_t , where the covariance between each pair of measurements is the crucial input. The individual analyses i are defined to be orthogonal, such that each measurement is statistically uncorrelated with every other measurement. The exception is the CMS secondary vertex analysis [17], which overlaps statistically with the dilepton and lepton + jets measurements [16,22]. Given the different nature of the observable in the secondary vertex analysis, the analyses are assumed to be uncorrelated. Taking the maximal statistical correlation allowed by the overlap produces no significant impact on the combination.

The measurements are affected by similar systematic uncertainties, and the assessment of their correlation is central to the combination. As the treatment of systematic uncertainties differs between ATLAS and CMS, for each measurement they are mapped onto 25 categories that group together similar sources of uncertainties. Uncertainty categories can influence m_t in opposite directions for different measurements, as seen in the ATLAS combinations [15,23], and this effect is included via negative correlations. The correlations between pairs of measurements from a single experiment for each category are evaluated by summing the covariance matrices of all the

input uncertainty sources, mainly using the correlation assumptions discussed in Refs. [16,23]. Differences relative to Refs. [16,23] are discussed in the Supplemental Material [43]. Each input uncertainty source is included irrespective of whether it is statistically significant.

The correlation strength ρ between ATLAS and CMS for each uncertainty category is assessed based on the similarities of the underlying models and methods, and of the estimates used. Three different cases are identified, with corresponding assumed correlation strengths: $\rho = 0.85$ (strongly correlated), $\rho = 0.5$ (partially correlated), and $\rho = 0$ (uncorrelated). No category was identified to have $\rho = 1$, which reflects the many differences between the two experiments. The correlation coefficient between an ATLAS and CMS measurement for each category is the product of the respective correlation strength and the signs of the impacts of that category on each measurement. In this way, for a given pair of measurements, categories that impact m_t in the same (opposite) direction have a positive (negative) correlation. For categories composed of multiple uncertainty sources (e.g., b tagging in ATLAS), the sign of the combined impact is not determined. In this case, the sign of the combined impact is assumed to be positive and it was checked that taking the alternative assumption of a negative sign does not significantly impact the result, with the largest change in the central value (uncertainty) being 41 (7) MeV. In calculating the final covariance matrix, it is assumed that each category is uncorrelated to the others.

Table I displays the correlation strengths between ATLAS and CMS for each systematic uncertainty category, and the Supplemental Material [43] provides tables with the uncertainties for all 15 measurements. The corresponding correlation coefficients are available in HEPData [47,48]. The subsequent paragraphs outline the categorization of systematic uncertainties and their corresponding correlation assessments.

The JES uncertainty is important in many m_t measurements. Six categories are used to describe the uncertainties associated with the calibration of the JES that are in common between the experiments [49–52]. The category JES 1 includes contributions from the limited size of the data samples used to derive the JES corrections and contributions due to pileup and its time-dependent variation. For ATLAS (7 TeV only), it also includes an uncertainty term from the effects of close-by jet activity. This category is uncorrelated between ATLAS and CMS measurements. The category JES 2 corresponds to the uncertainties from the absolute JES determined using γ/Z + jets events that are not included in JES 1. There are significant differences between the ATLAS and CMS approaches [49,50], including differences in the jet radius, treatment of muons in jets, and methods to correct for additional radiation. Hence, this category is treated as uncorrelated. The category JES 3 corresponds to the

TABLE I. Correlation strengths ρ of the systematic uncertainty categories between ATLAS and CMS, as used in the combination. The categories are defined in the text. Categories indicated with the symbol ... in the second column correspond to uncertainties specific to a single experiment. The third column shows the range of ρ scanned for stability checks. The changes in the combination's central value m_t and uncertainty σ_{m_t} corresponding to each correlation variation are shown in the last two columns.

Uncertainty category	ρ	Scan range	$\Delta m_t/2$ (MeV)	$\Delta \sigma_{m_t}/2$ (MeV)

modeling uncertainty in the relative η intercalibration [51,52]. Both experiments use dijet events for this calibration, and the modeling uncertainty originates from the use of different generators to predict the radiation patterns in these events. As similar but not identical generators and techniques are used in both experiments, JES 3 is treated as partially correlated.

The remaining JES categories correspond to the flavor-dependent calibration uncertainties. The category b -JES corresponds to the jet energy response uncertainty for b quark jets. The category g -JES corresponds to the uncertainty in the jet response of gluon jets for CMS and the uncertainty in the difference of the jet response of gluons to light-quark (u, d, s, c) jets for ATLAS. In both cases, MC comparisons determine the flavor-dependent effects, hence a strong correlation is used for the b -JES and g -JES components. The category l -JES includes the combined CMS uncertainty in the jet response of light-quark jets and the ATLAS uncertainty for the flavor composition of jets in $t\bar{t}$ events. As these uncertainty sources are different, the l -JES component is treated as uncorrelated. One additional flavor uncertainty category CMS JES 1 is included for the CMS 7 TeV measurements, corresponding to the full

envelope of the response dependencies for gluons and all quark flavors.

The jet energy resolution (JER) uncertainty affects all measurements, and one category is used for the corresponding uncertainties. ATLAS and CMS both measure the JER using data [51,52], hence this category is treated as uncorrelated.

The energy scale, efficiency, and resolution of leptons affect the m_t measurements, and one category is used for the corresponding uncertainties. ATLAS and CMS both calibrate the lepton energy scales, resolutions, and efficiencies using resonances that decay into dilepton pairs. Since the calibration samples are independent between the two experiments, and detector technologies and reconstruction algorithms are different, this category is treated as uncorrelated.

The selection criteria for many top quark measurements make use of b tagging. The uncertainty in the efficiency and rejection rate of these algorithms can impact the m_t measurements, and one category is used for the corresponding uncertainties. Both collaborations use dijet events to calibrate the b -tagging efficiency, employing equivalent methods [53,54] that depend on similar simulation setups.

As the ATLAS b jet calibration (unlike the CMS one) also uses $t\bar{t}$ events [53], this category is assessed as partially, rather than strongly, correlated.

The missing transverse momentum (p_T^{miss}) is estimated in the two experiments with different algorithms. Thus, the uncertainty in the p_T^{miss} scale originating from energy deposits not included in the reconstruction of jets or leptons is treated as uncorrelated.

The high instantaneous luminosity of the LHC results in multiple interactions in each bunch crossing (pileup). As the modeling of pileup relies on simulation, the correlation between ATLAS and CMS is assessed to be strong. While for other categories, the correlation strength is independent of the dataset, the pileup category has zero correlation between analyses performed at 7 and 8 TeV due to the different pileup conditions in the two datasets.

The uncertainty in the efficiency of the triggers used to select events typically have a small impact on the measurements. As the triggers are calibrated in independent datasets, the uncertainty is treated as uncorrelated between ATLAS and CMS.

The m_t measurements rely on MC simulation of $t\bar{t}$ events to relate the reconstructed observables to m_t . The corresponding modeling uncertainties are encompassed in seven uncertainty categories. The category ME generator includes uncertainties originating from the choice of the ME generator. ATLAS assesses this uncertainty by comparing the results obtained using an MC@NLO [55,56] sample with the POWHEG sample. CMS assesses this uncertainty by comparing the results obtained using a POWHEG sample with the MadGraph sample. As the experiments employ different nominal MC models, the category is treated as partially correlated. The category QCD radiation includes uncertainty sources for the modeling of QCD radiation in $t\bar{t}$ events. For the ATLAS measurements, samples with parameter variations of the initial- and final-state radiation in PYTHIA, and the h_{damp} parameter in POWHEG (which controls ME/PS matching and effectively regulates high- p_T QCD radiation) are used to evaluate these uncertainties. For the CMS measurements, samples with variations of the factorization, renormalization, and matching scales are used. Similarly to the ME category, the QCD radiation category is treated as partially correlated between the two experiments.

In the ATLAS analyses, the uncertainty originating from the hadronization model is evaluated by using an alternative PS and hadronization generator (POWHEG+HERWIG6 [57]). CMS addresses similar uncertainties by separately varying the b quark fragmentation function and the semileptonic branching ratios (CMS b hadron \mathcal{B}). As the ATLAS approach changes many aspects of the simulation that are not changed in the two CMS uncertainty sources and the PYTHIA settings in the two experiments are not the same, there is no clear mapping and correlation for these sources. Nevertheless, some degree of correlation is

expected, hence the ATLAS hadronization uncertainty is grouped with the CMS uncertainty from the fragmentation model in the category hadronization and this category is assumed to be partially correlated between the experiments. The CMS b hadron \mathcal{B} uncertainty source is treated as uncorrelated with the ATLAS uncertainties. It was verified that the alternative treatment of correlating the ATLAS hadronization uncertainty with the CMS b hadron \mathcal{B} uncertainty had no significant impact on the result.

The uncertainties associated with color reconnection and the underlying event tunes are included in separate categories. The experiments use different PYTHIA settings for the nominal simulation, and these uncertainty categories are taken to be partially correlated. The uncertainty in the parton distribution functions (PDFs) is driven by the input data used in the PDF extractions, and hence this category is taken as strongly correlated between ATLAS and CMS. The CMS analyses account for an uncertainty in the modeling of the top quark p_T distribution, represented by a separate category, while for the ATLAS analyses, the alternative MC sample used to evaluate the hadronization uncertainty covers the disagreement between data and simulation [58], and no additional uncertainty is evaluated.

The analyses typically have small contributions from background processes, and background uncertainties have only a small impact on the measurements. Uncertainties in backgrounds estimated from data control samples are included in the category Background (data), treated as uncorrelated between the experiments. Both ATLAS and CMS rely on MC simulation for several backgrounds. The uncertainties in these are included in the category Background (MC), assumed to be strongly correlated.

Every analysis ensures that the m_t fit is unbiased. This is done using simulated samples generated with different m_t values. The limited sample size introduces a systematic uncertainty (Method) that is statistical and hence uncorrelated between measurements.

A few systematic uncertainties affect only a limited number of analyses (see the Supplemental Material [43]). These uncertainty sources are in the category Other, which is uncorrelated between ATLAS and CMS.

The measurements from each experiment are separately combined, with the ATLAS combination giving $m_t = 172.71 \pm 0.25(\text{stat}) \pm 0.41(\text{syst})$ GeV and the CMS combination giving $m_t = 172.52 \pm 0.14(\text{stat}) \pm 0.39(\text{syst})$ GeV. The ATLAS combination is very similar to, and supersedes, the result in Ref. [23], with the slight difference originating from changes in the correlation assumptions that are discussed in the Supplemental Material [43]. The CMS measurement is improved compared to the previous combination [16] and supersedes that result. The improvement originates from including a more precise dilepton measurement at 8 TeV together with the single top, secondary vertex, and J/ψ meson measurements, and from including the effect of anticorrelations of

FIG. 1. Comparison of the individual m_t measurements and the result of the m_t combination. Also shown are the separate combinations of each experiment and the result of the simultaneous combination for the different decay channels, where the “other” category covers the single top, J/ψ , and secondary vertex measurements.

the systematic uncertainties between the input measurements. It was verified that performing the combinations with a likelihood-based approach [59] gives identical results.

The combination of all 15 input measurements gives

$$m_t = 172.52 \pm 0.14(\text{stat}) \pm 0.30(\text{syst}) \text{ GeV},$$

which is compared with the input measurements in Fig. 1. The LHC combination has the same statistical uncertainty as the CMS combination. This is because the figure of merit in BLUE is the total uncertainty, and the statistical component is a consequence of the optimized weights in the combination. The difference in statistical uncertainty between ATLAS and CMS reflects different analysis choices, as explained in the Supplemental Material [43].

The combination achieves an improvement in the total m_t uncertainty of 31% relative to the most precise input measurement. The measurements with the largest weight in the combination are the CMS 8 TeV lepton + jets (0.34), dilepton (0.12), and all-jets (0.12) results, and the ATLAS 8 TeV lepton + jets (0.17) and dilepton (0.16) measurements. The hierarchy of the weights originates from the uncertainty of each measurement, as well as the correlation between measurements. For example, the ATLAS 8 TeV lepton + jets measurement has a higher weight than the corresponding dilepton measurement, despite having a larger uncertainty. This is because of the smaller correlation

TABLE II. Uncertainties on the m_t values extracted in the LHC, ATLAS, and CMS combinations arising from the same categories as listed in Table I, sorted in order of decreasing value of the combined LHC uncertainty.

with the precise CMS 8 TeV lepton + jets measurement. The combination shows good compatibility between the measurements, with $\chi^2 = 7.5$ and a corresponding p value of 91%. The LHC combination is much closer to the CMS combination than the ATLAS one because the relative weights of the measurements with slightly lower measured m_t are higher in the LHC combination than in the per-experiment combinations. All weights and the individual pulls can be found in the Supplemental Material [43], along with a combination where all 15 measurements are used to extract separate m_t values for ATLAS and CMS.

Table II shows the breakdown of the systematic uncertainty in the combined measurement and the individual ATLAS and CMS combinations. The largest systematic uncertainties are seen to originate from JES, b tagging, and $t\bar{t}$ modeling. The stability of the measurement against the correlation assumptions is checked by varying the correlation strengths for each uncertainty category as shown in Table I. The ranges reflect the extent of the understanding

of the correlations. No variation is performed for categories where there is no ambiguity in the correlation assumption. Table I shows the variation in the total uncertainty and central value of the combination under those changes. Both the central value and uncertainty are observed to vary linearly under the variations and the changes are small (< 30 MeV) compared to the uncertainty in m_t . The largest change in central value is seen for b -JES, which is the leading correlated uncertainty source in the combination.

The consistency of the result and the measurements from the different decay channels have been checked by performing the combination with a separate m_t parameter for each $t\bar{t}$ decay channel. The results are also shown in Fig. 1, and the m_t values are found to be consistent.

The impact of the limited statistical precision of the estimates of the systematic uncertainties is evaluated by performing pseudo-experiments where the systematic uncertainties of the measurements are varied according to their uncertainties and the combination procedure is repeated. In this procedure, changes in the sign of the impacts of systematic uncertainties are propagated to the signs of the corresponding correlations. The root-mean-square of the measured m_t (σ_{m_t}) is found to be 63 (19) MeV, demonstrating the stability of the combination.

The understanding of top quark production and decay has continued to evolve since the publication of the measurements used in this combination. Developments in the simulations include improved modeling of off-shell effects [60], reduced uncertainties in additional QCD radiation [61,62], new models of color reconnection [63,64], MC simulations at next-to-NLO precision in QCD [65], and investigations into the radiation patterns in the top quark decay [66]. Advancements in the modeling, which may either increase or decrease the mass uncertainty, and improvements in analysis techniques [29,33] are being incorporated into analyses performed at $\sqrt{s} = 13$ TeV, but this is not possible for the analyses used in this combination. A cross-check, detailed in the Supplemental Material [43], was performed to verify that potential modeling uncertainties in the recoil in the top quark decay [66] do not significantly affect the combination.

In summary, a combination of top quark mass measurements by the ATLAS and CMS experiments at the CERN LHC in proton-proton collisions at $\sqrt{s} = 7$ and 8 TeV has been performed. The combination yields $m_t = 172.52 \pm 0.33$ GeV, which is the most precise result to date.

CMS congratulates our colleagues in the CERN accelerator departments for the excellent performance of the LHC and thank the technical and administrative staffs at CERN and at other CMS institutes for their contributions to the success of the CMS effort. In addition, we gratefully acknowledge the computing centers and personnel of the Worldwide LHC Computing Grid and other centers for

delivering so effectively the computing infrastructure essential to our analyses. Finally, we acknowledge the enduring support for the construction and operation of the LHC, the CMS detector, and the supporting computing infrastructure provided by the following funding agencies: SC (Armenia), BMBWF and FWF (Austria); FNRS and FWO (Belgium); CNPq, CAPES, FAPERJ, FAPERGS, and FAPESP (Brazil); MES and BNSF (Bulgaria); CERN; CAS, MoST, and NSFC (China); MINCIENCIAS (Colombia); MSES and CSF (Croatia); RIF (Cyprus); SENESCYT (Ecuador); ERC PRG, RVTT3 and TK202 (Estonia); Academy of Finland, MEC, and HIP (Finland); CEA and CNRS/IN2P3 (France); SRNSF (Georgia); BMBF, DFG, and HGF (Germany); GSRI (Greece); NKFIH (Hungary); DAE and DST (India); IPM (Iran); SFI (Ireland); INFN (Italy); MSIP and NRF (Republic of Korea); MES (Latvia); LAS (Lithuania); MOE and UM (Malaysia); BUAP, CINVESTAV, CONACYT, LNS, SEP, and UASLP-FAI (Mexico); MOS (Montenegro); MBIE (New Zealand); PAEC (Pakistan); MES and NSC (Poland); FCT (Portugal); MESTD (Serbia); MCIN/AEI and PCTI (Spain); MOSTR (Sri Lanka); Swiss Funding Agencies (Switzerland); MST (Taipei); MHESI and NSTDA (Thailand); TUBITAK and TENMAK (Turkey); NASU (Ukraine); STFC (United Kingdom); DOE and NSF (USA). We thank CERN for the very successful operation of the LHC and its injectors, as well as the support staff at CERN and at our institutions worldwide without whom ATLAS could not be operated efficiently. The crucial computing support from all WLCG partners is acknowledged gratefully, in particular from CERN, the ATLAS Tier-1 facilities at TRIUMF/SFU (Canada), NDGF (Denmark, Norway, Sweden), CC-IN2P3 (France), KIT/GridKA (Germany), INFN-CNAF (Italy), NL-T1 (Netherlands), PIC (Spain), RAL (UK) and BNL (USA), the Tier-2 facilities worldwide and large non-WLCG resource providers. Major contributors of computing resources are listed in Ref. [67]. We gratefully acknowledge the support of ANPCyT, Argentina; YerPhI, Armenia; ARC, Australia; BMWFW and FWF, Austria; ANAS, Azerbaijan; CNPq and FAPESP, Brazil; NSERC, NRC and CFI, Canada; CERN; ANID, Chile; CAS, MOST and NSFC, China; Minciencias, Colombia; MEYS CR, Czech Republic; DNRFB and DNSRC, Denmark; IN2P3-CNRS and CEA-DRF/IRFU, France; SRNSFG, Georgia; BMBF, HGF and MPG, Germany; GSRI, Greece; RGC and Hong Kong SAR, China; ISF and Benozziyo Center, Israel; INFN, Italy; MEXT and JSPS, Japan; CNRST, Morocco; NWO, Netherlands; RCN, Norway; MEiN, Poland; FCT, Portugal; MNE/IFA, Romania; MESTD, Serbia; MSSR, Slovakia; ARRS and MIZŠ, Slovenia; DSI/NRF, South Africa; MICINN, Spain; SRC and Wallenberg Foundation, Sweden; SERI, SNSF and Cantons of Bern and Geneva, Switzerland; MOST, Taipei; TENMAK, Türkiye; STFC, United Kingdom; DOE and NSF, United States of America.

Individual groups and members have received support from BCKDF, CANARIE, CRC and DRAC, Canada; CERN-CZ, PRIMUS 21/SCI/017 and UNCE SCI/013, Czech Republic; COST, ERC, ERDF, Horizon 2020, ICSC-NextGenerationEU and Marie Skłodowska-Curie Actions, European Union; Investissements d'Avenir Labex, Investissements d'Avenir IDEX and ANR, France; DFG and AvH Foundation, Germany; Herakleitos, Thales and Aristeia programmes co-financed by EU-ESF and the Greek NSRF, Greece; BSF-NSF and MINERVA, Israel; Norwegian Financial Mechanism 2014-2021, Norway; NCN and NAWA, Poland; La Caixa Banking Foundation, CERCA Programme Generalitat de Catalunya and PROMETEO and GenT Programmes Generalitat Valenciana, Spain; Göran Gustafssons Stiftelse, Sweden; The Royal Society and Leverhulme Trust, United Kingdom. In addition, individual members wish to acknowledge support from Chile: Agencia Nacional de Investigación y Desarrollo (FONDECYT 1190886, FONDECYT 1210400, FONDECYT 1230812, FONDECYT 1230987); China: National Natural Science Foundation of China (NSFC—12175119, NSFC 12275265, NSFC-12075060); Czech Republic: PRIMUS Research Programme (PRIMUS/21/SCI/017); European Union: European Research Council (ERC—948254), Horizon 2020 Framework Programme (MUCCA—CHIST-ERA-19-XAI-00), European Union, Future Artificial Intelligence Research (FAIR-NextGenerationEU PE00000013), Italian Center for High Performance Computing, Big Data and Quantum Computing (ICSC, NextGenerationEU), Marie Skłodowska-Curie Actions (EU H2020 MSC IF Grant No. 101033496); France: Agence Nationale de la Recherche (ANR-20-CE31-0013, ANR-21-CE31-0013, ANR-21-CE31-0022), Investissements d'Avenir IDEX (ANR-11-LABX-0012), Investissements d'Avenir Labex (ANR-11-LABX-0012); Germany: Baden-Württemberg Stiftung (BW Stiftung-Postdoc Eliteprogramme), Deutsche Forschungsgemeinschaft (DFG - 469666862, DFG - CR 312/5-1); Italy: Istituto Nazionale di Fisica Nucleare (FELLINI G.A. n. 754496, ICSC, NextGenerationEU); Japan: Japan Society for the Promotion of Science (JSPS KAKENHI Grant No. 22KK0227, JSPS KAKENHI JP21H05085, JSPS KAKENHI JP22H01227, JSPS KAKENHI JP22H04944); Netherlands: Netherlands Organisation for Scientific Research (NWO Veni 2020—VI.Veni.202.179); Norway: Research Council of Norway (RCN-314472); Poland: Polish National Agency for Academic Exchange (PPN/PPO/2020/1/00002/U/00001), Polish National Science Centre (NCN 2021/42/E/ST2/00350, NCN OPUS nr 2022/47/B/ST2/03059, NCN UMO-2019/34/E/ST2/00393, UMO-2020/37/B/ST2/01043, UMO-2021/40/C/ST2/00187); Slovenia: Slovenian Research Agency (ARIS grant J1-3010); Spain: BBVA Foundation

(LEO22-1-603), Generalitat Valenciana (Artemisa, FEDER, IDIFEDER/2018/048), La Caixa Banking Foundation (LCF/BQ/PI20/11760025), Ministry of Science and Innovation (MCIN & NextGenEU-PCI2022-135018-2, MICIN & FEDER-PID2021-125273NB, RYC2019-028510-I, RYC2020-030254-I, RYC2021-031273-I, RYC2022-038164-I), PROMETEO and GenT Programmes Generalitat Valenciana (CIDEAGENT/2019/023, CIDEAGENT/2019/027); Sweden: Swedish Research Council (VR 2018-00482, VR 2022-03845, VR 2022-04683, VR Grant No. 2021-03651), Knut and Alice Wallenberg Foundation (KAW 2017.0100, KAW 2018.0157, KAW 2018.0458, KAW 2019.0447); Switzerland: Swiss National Science Foundation (SNSF—PCEFP2_194658); United Kingdom: Leverhulme Trust (Leverhulme Trust RPG-2020-004); United States of America: Neubauer Family Foundation.

³⁵⁷*Department of Particle Physics and Astrophysics, Weizmann Institute of Science, Rehovot, Israel*
³⁵⁸*Department of Physics, University of Wisconsin, Madison, Wisconsin, USA*
³⁵⁹*Fakultät für Mathematik und Naturwissenschaften, Fachgruppe Physik, Bergische Universität Wuppertal, Wuppertal, Germany*
³⁶⁰*Department of Physics, Yale University, New Haven, Connecticut, USA*

^aDeceased.

^bAlso at Yerevan State University, Yerevan, Armenia.

^cAlso at TU Wien, Vienna, Austria.

^dAlso at Institute of Basic and Applied Sciences, Faculty of Engineering, Arab Academy for Science, Technology and Maritime Transport, Alexandria, Egypt.

^eAlso at Ghent University, Ghent, Belgium.

^fAlso at Universidade Estadual de Campinas, Campinas, Brazil.

^gAlso at Federal University of Rio Grande do Sul, Porto Alegre, Brazil.

^hAlso at UFMS, Nova Andradina, Brazil.

ⁱAlso at Nanjing Normal University, Nanjing, China.

^jAlso at The University of Iowa, Iowa City, Iowa, USA.

^kAlso at University of Chinese Academy of Sciences, Beijing, China.

^lAlso at China Center of Advanced Science and Technology, Beijing, China.

^mAlso at University of Chinese Academy of Sciences, Beijing, China.

ⁿAlso at China Spallation Neutron Source, Guangdong, China.

^oAlso at Henan Normal University, Xinxiang, China.

^pAlso at Université Libre de Bruxelles, Bruxelles, Belgium.

^qAlso at University of Latvia (LU), Riga, Latvia.

^rAlso at Another institute or international laboratory covered by a cooperation agreement with CERN.

^sAlso at Cairo University, Cairo, Egypt.

^tAlso at Suez University, Suez, Egypt.

^uAlso at British University in Egypt, Cairo, Egypt.

^vAlso at Birla Institute of Technology, Mesra, Mesra, India.

^wAlso at Purdue University, West Lafayette, Indiana, USA.

^xAlso at Université de Haute Alsace, Mulhouse, France.

^yAlso at Department of Physics, Tsinghua University, Beijing, China.

^zAlso at The University of the State of Amazonas, Manaus, Brazil.

^{aa}Also at Erzincan Binali Yildirim University, Erzincan, Turkey.

^{bb}Also at University of Hamburg, Hamburg, Germany.

^{cc}Also at RWTH Aachen University, III. Physikalisches Institut A, Aachen, Germany.

^{dd}Also at Isfahan University of Technology, Isfahan, Iran.

^{ee}Also at Bergische University Wuppertal (BUW), Wuppertal, Germany.

^{ff}Also at Brandenburg University of Technology, Cottbus, Germany.

^{gg}Also at Forschungszentrum Jülich, Jülich, Germany.

^{hh}Also at CERN, European Organization for Nuclear Research, Geneva, Switzerland.

ⁱⁱAlso at Institute of Physics, University of Debrecen, Debrecen, Hungary.

^{jj}Also at Institute of Nuclear Research ATOMKI, Debrecen, Hungary.

^{kk}Also at Universitatea Babeş-Bolyai—Facultatea de Fizica, Cluj-Napoca, Romania.

^{ll}Also at Physics Department, Faculty of Science, Assiut University, Assiut, Egypt.

^{mm}Also at HUN-REN Wigner Research Centre for Physics, Budapest, Hungary.

ⁿⁿAlso at Punjab Agricultural University, Ludhiana, India.

^{oo}Also at University of Visva-Bharati, Santiniketan, India.

^{pp}Also at Indian Institute of Science (IISc), Bangalore, India.

^{qq}Also at IIT Bhubaneswar, Bhubaneswar, India.

^{rr}Also at Institute of Physics, Bhubaneswar, India.

^{ss}Also at University of Hyderabad, Hyderabad, India.

^{tt}Also at Deutsches Elektronen-Synchrotron, Hamburg, Germany.

- ^{uu} Also at Department of Physics, Isfahan University of Technology, Isfahan, Iran.
- ^{vv} Also at Sharif University of Technology, Tehran, Iran.
- ^{ww} Also at Department of Physics, University of Science and Technology of Mazandaran, Behshahr, Iran.
- ^{xx} Also at Helwan University, Cairo, Egypt.
- ^{yy} Also at Italian National Agency for New Technologies, Energy and Sustainable Economic Development, Bologna, Italy.
- ^{zz} Also at Centro Siciliano di Fisica Nucleare e di Struttura Della Materia, Catania, Italy.
- ^{aaa} Also at Università degli Studi Guglielmo Marconi, Roma, Italy.
- ^{bbb} Also at Scuola Superiore Meridionale, Università di Napoli 'Federico II', Napoli, Italy.
- ^{ccc} Also at Fermi National Accelerator Laboratory, Batavia, Illinois, USA.
- ^{ddd} Also at Laboratori Nazionali di Legnaro dell'INFN, Legnaro, Italy.
- ^{eee} Also at Ain Shams University, Cairo, Egypt.
- ^{fff} Also at Consiglio Nazionale delle Ricerche—Istituto Officina dei Materiali, Perugia, Italy.
- ^{ggg} Also at Riga Technical University, Riga, Latvia.
- ^{hhh} Also at Department of Applied Physics, Faculty of Science and Technology, Universiti Kebangsaan Malaysia, Bangi, Malaysia.
- ⁱⁱⁱ Also at Consejo Nacional de Ciencia y Tecnología, Mexico City, Mexico.
- ^{jjj} Also at Trincomalee Campus, Eastern University, Sri Lanka, Nilaveli, Sri Lanka.
- ^{kkk} Also at Saegis Campus, Nugegoda, Sri Lanka.
- ^{lll} Also at INFN Sezione di Pavia, Università di Pavia, Pavia, Italy.
- ^{mmm} Also at National and Kapodistrian University of Athens, Athens, Greece.
- ⁿⁿⁿ Also at Ecole Polytechnique Fédérale Lausanne, Lausanne, Switzerland.
- ^{ooo} Also at Universität Zürich, Zurich, Switzerland.
- ^{ppp} Also at Stefan Meyer Institute for Subatomic Physics, Vienna, Austria.
- ^{qqq} Also at Laboratoire d'Annecy-le-Vieux de Physique des Particules, IN2P3-CNRS, Annecy-le-Vieux, France.
- ^{rrr} Also at Near East University, Research Center of Experimental Health Science, Mersin, Turkey.
- ^{sss} Also at Konya Technical University, Konya, Turkey.
- ^{ttt} Also at Izmir Bakircay University, Izmir, Turkey.
- ^{uuu} Also at Adiyaman University, Adiyaman, Turkey.
- ^{vvv} Also at Bozok Universitetesi Rektörlüğü, Yozgat, Turkey.
- ^{www} Also at Marmara University, Istanbul, Turkey.
- ^{xxx} Also at Milli Savunma University, Istanbul, Turkey.
- ^{yyy} Also at Kafkas University, Kars, Turkey.
- ^{zzz} Also at Istanbul Okan University, Istanbul, Turkey.
- ^{aaaa} Also at Hacettepe University, Ankara, Turkey.
- ^{bbbb} Also at Istanbul University—Cerrahpasa, Faculty of Engineering, Istanbul, Turkey.
- ^{cccc} Also at Yildiz Technical University, Istanbul, Turkey.
- ^{dddd} Also at Vrije Universiteit Brussel, Brussel, Belgium.
- ^{eeee} Also at School of Physics and Astronomy, University of Southampton, Southampton, United Kingdom.
- ^{ffff} Also at University of Bristol, Bristol, United Kingdom.
- ^{gggg} Also at IPPP Durham University, Durham, United Kingdom.
- ^{hhhh} Also at Monash University, Faculty of Science, Clayton, Australia.
- ⁱⁱⁱⁱ Also at Università di Torino, Torino, Italy.
- ^{jjjj} Also at Bethel University, St. Paul, Minnesota, USA.
- ^{kkkk} Also at Karamanoğlu Mehmetbey University, Karaman, Turkey.
- ^{llll} Also at California Institute of Technology, Pasadena, California, USA.
- ^{mmmm} Also at United States Naval Academy, Annapolis, Maryland, USA.
- ⁿⁿⁿⁿ Also at Bingol University, Bingol, Turkey.
- ^{oooo} Also at Georgian Technical University, Tbilisi, Georgia.
- ^{pppp} Also at Sinop University, Sinop, Turkey.
- ^{qqqq} Also at Erciyes University, Kayseri, Turkey.
- ^{rrrr} Also at Horia Hulubei National Institute of Physics and Nuclear Engineering (IFIN-HH), Bucharest, Romania.
- ^{ssss} Also at Texas A&M University at Qatar, Doha, Qatar.
- ^{tttt} Also at Kyungpook National University, Daegu, Korea.
- ^{uuuu} Also at Universiteit Antwerpen, Antwerpen, Belgium.
- ^{vvvv} Also at Northeastern University, Boston, Massachusetts, USA.
- ^{wwww} Also at Imperial College, London, United Kingdom.
- ^{xxxx} Also at Yerevan Physics Institute, Yerevan, Armenia.
- ^{yyyy} Also at Institute of Nuclear Physics of the Uzbekistan Academy of Sciences, Tashkent, Uzbekistan.
- ^{zzzz} Also at Department of Physics, King's College London, London, United Kingdom.
- ^{aaaaa} Also at Institute of Physics, Azerbaijan Academy of Sciences, Baku, Azerbaijan.
- ^{bbbbb} Also at Lawrence Livermore National Laboratory, Livermore, USA.

- cccc Also at TRIUMF, Vancouver, British Columbia, Canada.
- dddd Also at Department of Physics, University of Thessaly, Greece.
- eeeee Also at An-Najah National University, Nablus, Palestine.
- ffff Also at Department of Physics, University of Fribourg, Fribourg, Switzerland.
- ggggg Also at University of Colorado Boulder, Department of Physics, Colorado, USA.
- hhhhh Also at Department of Physics, Westmont College, Santa Barbara, USA.
- iiiiii Also at Departament de Fisica de la Universitat Autònoma de Barcelona, Barcelona, Spain.
- jjjjj Also at Affiliated with an institute covered by a cooperation agreement with CERN.
- kkkkk Also at The Collaborative Innovation Center of Quantum Matter (CICQM), Beijing, China.
- lllll Also at Department of Physics, Ben Gurion University of the Negev, Beer Sheva, Israel.
- mmmmm Also at Università di Napoli Parthenope, Napoli, Italy.
- nnnnn Also at Institute of Particle Physics (IPP), Canada.
- ooooo Also at Borough of Manhattan Community College, City University of New York, New York, New York, USA.
- ppppp Also at National Institute of Physics, University of the Philippines Diliman (Philippines), Philippines.
- qqqqq Also at Department of Financial and Management Engineering, University of the Aegean, Chios, Greece.
- rrrrr Also at Department of Physics, Stanford University, Stanford, California, USA.
- sssss Also at Centro Studi e Ricerche Enrico Fermi, Italy.
- ttttt Also at Institucio Catalana de Recerca i Estudis Avancats, ICREA, Barcelona, Spain.
- uuuuu Also at Technical University of Munich, Munich, Germany.
- vvvvv Also at Yeditepe University, Physics Department, Istanbul, Türkiye.
- wwwww Also at Institute of Theoretical Physics, Iliia State University, Tbilisi, Georgia.
- xxxxx Also at CERN, Geneva, Switzerland.
- yyyyy Also at Center for Interdisciplinary Research and Innovation (CIRI-AUTH), Thessaloniki, Greece.
- zzzzz Also at Hellenic Open University, Patras, Greece.
- aaaaa Also at Center for High Energy Physics, Peking University, China.
- bbbbbb Also at Department of Physics, Stellenbosch University, South Africa.
- cccccc Also at L2IT, Université de Toulouse, CNRS/IN2P3, UPS, Toulouse, France.
- dddddd Also at Department of Physics, California State University, Sacramento, USA.
- eeeeee Also at Département de Physique Nucléaire et Corpusculaire, Université de Genève, Genève, Switzerland.
- ffffff Also at Institute for Nuclear Research and Nuclear Energy (INRNE) of the Bulgarian Academy of Sciences, Sofia, Bulgaria.
- gggggg Also at Washington College, Chestertown, Maryland, USA.
- hhhhhh Also at Institut für Experimentalphysik, Universität Hamburg, Hamburg, Germany.
- iiiiii Also at Institute of Applied Physics, Mohammed VI Polytechnic University, Ben Guerir, Morocco.
- jjjjjj Also at Institute of Physics and Technology, Mongolian Academy of Sciences, Ulaanbaatar, Mongolia.
- kkkkkk Also at University of Chinese Academy of Sciences (UCAS), Beijing, China.
